Physics 112 Practice 21: Lenses

Learning Outcomes

- To learn about the two main types of lenses and how to draw ray-tracing diagrams for each type.
- To calculate the location and appearance of the image formed by a lens.

Notes and Concept Questions

- Lenses use refraction to bend light rays such that they form an image of an object. Convex lenses are converging. Concave lenses are diverging. Both types have focal points on each side of the lens.
- The lens equation: $1/d_o + 1/d_i = 1/f$. (Note that this is also the mirror equation).
- Magnification: $M = h_i/h_o = -d_i/d_o$ (also the same as for mirrors).
- Ray tracing diagrams (note that in the diagrams, the *C* ray is labeled the *M* ray):
 - *P* ray: starts parallel to optical axis, hits lens, and bends toward *F* on opposite side (convex) or away from *F* on same side (concave).
 - *F* ray: starts toward *F* on same side (convex) or opposite side (concave), hits lens, and bends parallel to axis.
 - *C* ray: goes straight through the center/middle of the lens.

Sign Conventions		
Sign	Positive	Negative
f	Convex (Converging)	Concave (Diverging)
M	Upright Image	Inverted Image
d_i	Real Image (Opposite Side as object)	Virtual Image (Same Side as object)

Q1. If you wanted to use a lens to focus sunlight to start a fire (yay!), which kind of lens would you choose?

1. either would work well

2. a concave lens → Can only produce VIRTUAL images

3. a convex lens

→ Can produce a REAL image
