[Brain Networks for Studying Healthy and Pathological Aging Mechanisms and Intervention Efficacy](#) Christos Frantzidis, Ana B. Vivas, Panagiotis D. Bamidis, 2020-11-18 Previous studies showed that both healthy and pathological aging are associated with changes in brain structure and function of the mature human brain The most prominent anatomical alteration are changes in prefrontal cortex morphology volume loss and reduced white matter integrity and hippocampal atrophy Cognitive decline affects mainly the performance of episodic memory speed of sensory information processing working memory inhibitory function and long term memory It has been also proposed that due to the aforementioned changes the aging brain engages in compensatory brain mechanism such as a broader activation of cortical regions mainly frontal rather than specialized activation Evidence suggests that similar changes occur with pathological aging but to a greater extent In this case information flow is disrupted due to neurodegeneration functional activation of

posterior occipito temporal regions is decreased and as a consequence the brain fails to process sensorial input in the ventral pathway and cognitive deficits appear In the last years functional alterations associated with aging have been studied using the mathematical notion of graph theory that offers an integrative approach since it examines different properties of the brain network 1 Organization level 2 amount of local information processing 3 information flow 4 cortical community structure and 5 identification of functional anatomical hubs So graph theory offers an attractive way to model brain networks organization and to quantify their pathological deviations Previous studies have already employed this mathematical notion and demonstrated that age related neurodegeneration is often accompanied by loss of optimal network organization either due to diminished local information processing or due to progressive isolation of distant brain regions They have also found that changes in network properties may be present even in the preclinical phase which could be taken as a biological marker of disease

Emotional Modulation of the Synapse Christa McIntyre,Jonathan Eric Ploski,2015-08-21 Highly emotional events tend to be well remembered The adaptive value in this is clear those events that have a bearing on survival should be stored for future use as long term memories whereas memories of inconsequential events would not as likely contribute to future survival Enduring changes in the structure and function of synapses neural circuitry and ultimately behavior can be modulated by highly aversive or rewarding experiences In the last decade the convergence of cellular molecular and systems neuroscience has produced new insights into the biological mechanisms that determine whether a memory will be stored for the long term or lost forever This Research Topic brings together leading experts who work at multiple levels of analysis to reveal recent discoveries and concepts regarding the synaptic mechanisms of consolidation and extinction of emotionally arousing memories

Murder in the Courtroom Brigitte Vallabhajosula Ph.D.,2015-01-02 Answers to many legal questions often depend on our understanding of the relationship between the human brain and behavior While there is no evidence to suggest that violence is the sole result of cognitive impairment research does suggest that frontal lobe impairment in particular may contribute to the etiology of violent

behavior Murder in the Courtroom presents a comprehensive and detailed analysis of issues most relevant to answering questions regarding the link between cognitive functioning and violence It is the first book to focus exclusively on the etiology and assessment of cognitive impairment in the context of violent behavior and the challenges courts face in determining the reliability of neuroscience evidence provide objective discussions of currently available neuropsychological tests and neuroimaging techniques and their strengths and limitations provide a methodology for the assessment of cognitive dysfunction in the context of violent behavior that is likely to withstand a Daubert challenge and include detailed discussions of criminal cases to illustrate important points Clinical and forensic psychologists and psychiatrists cognitive neuroscientists and legal professionals will be able to use this book to further their understanding of the relationship between brain function and extreme violence      Step In, Step Up Jane A. Lilienfeld, 2013-05-16 This provocative account of our obsession with neuroscience brilliantly illuminates what contemporary neuroscience and brain imaging can and cannot tell us about ourselves providing a much needed reminder about the many factors that make us who we are What can t neuroscience tell us about ourselves Since fMRI functional magnetic resonance imaging was introduced in the early 1990s brain scans have been used to help politicians understand and manipulate voters determine guilt in court cases and make sense of everything from musical aptitude to romantic love br In Brainwashed psychiatrist and AEI scholar Sally Satel and psychologist Scott O Lilienfeld reveal how many of the real world applications of

human neuroscience gloss over its limitations and intricacies at times obscuring rather than clarifying the myriad factors that shape our behavior and identities Brain scans Satel and Lilienfeld show are useful but often ambiguous representations of a highly complex system Each region of the brain participates in a host of experiences and interacts with other regions so seeing one area light up on an fMRI in response to a stimulus doesn't automatically indicate a particular sensation or capture the higher cognitive functions that come from those interactions The narrow focus on the brain's physical processes also assumes that our subjective experiences can be explained away by biology alone As Satel and Lilienfeld explain this neurocentric view of the mind risks undermining our most deeply held ideas about selfhood free will and personal responsibility putting us at risk of making harmful mistakes whether in the courtroom interrogation room or addiction treatment clinic Although brain scans and other neurotechnologies have provided groundbreaking insights into the workings of the human brain Brainwashed shows readers that the increasingly fashionable idea that they are the most important means of answering the enduring mysteries of psychology is misguided and potentially dangerous

**From Brain to Body: The Impact of Nervous System Declines on Muscle Performance in Aging** Brian C. Clark, Timothy D. Law Sr., S. Lee Hong, 2015-12-18 Download PDF Download EPUB The deterioration of skeletal muscle performance e.g. declines in muscle strength and motor performance with advancing age has long been anecdotally recognized as Shakespeare pointed out nearly a half millennium ago in his monologue The Seven Ages of Man and has been of scientific interest for well over a century Over the past several decades the scientific and medical communities have recognized that reduced skeletal muscle performance is a debilitating and life threatening condition in the elderly For example the age associated loss of muscle strength as well as impairment in the ability to finely control movement is highly associated with physical disability and difficulty performing activities of daily living While the nervous system is widely recognized for its role in controlling skeletal muscle during motor function its role in determining the performance characteristics of aged skeletal muscle has largely been understudied Historically it was believed that these reductions in muscle performance were primarily resultant of age associated adaptations in skeletal muscle e.g. muscle atrophy However aging is associated with widespread qualitative and quantitative changes in both the central and peripheral nervous systems that are likely to influence numerous aspects of muscle performance such as muscle strength fatigue and motor control as well as mobility In this research topic we sought to examine a broad range of issues surrounding 1 the age related changes in nervous system anatomical physiological and biochemical changes in the central and/or peripheral nervous systems 2 the functional role of these nervous system changes in contributing to altered skeletal muscle performance and/or mobility and 3 physical and pharmacologic interventions that act via the nervous system to enhance muscle performance and/or mobility Researchers and academicians engaged in aging neuroscience and/or applied physiology research focused within the scope of this research topic were encouraged to contribute an original research article review article clinical case study hypothesis and theory article method article opinion

article or technology report to this research topic Herein we present a series of outstanding articles within this scope of work including a last minute addition article from Wiesmeier Dalin and Maurer that is not mentioned in the editorial that we hope will help to vertically advance the intersecting fields of aging geriatrics and neuroscience Lastly as the editors we wish to thank all article contributors and peer reviewers for their efforts in contributing to this Research Topic journal issue book Additionally we would like to thank people everywhere who volunteer their time and body for human subjects research studies such that are presented herein It is the wonderful individuals who are willing to participate in experiments that make scientific exploration and health and medical advancements possible      **Switch On Your Brain** Dr. Caroline
