PPs objectives

What are the steps involved in making a protein?

Background/Intro

What is a protein? what does it do? How does it get made? The process of making a protein is called protein synthesis. It involves two main steps: transcription and translation. Transcription is the process of making an mRNA copy of a gene. Translation is the process of making a protein from an mRNA copy. The steps involved in making a protein are: 1. Transcription: The DNA double helix is unwound, and one strand is used as a template to synthesize a complementary mRNA strand. 2. Translation: The mRNA strand is read by a ribosome, which uses transfer RNA (tRNA) molecules to bring amino acids to the growing polypeptide chain.

So, the steps involved in making a protein are: 1. Transcription: The DNA double helix is unwound, and one strand is used as a template to synthesize a complementary mRNA strand. 2. Translation: The mRNA strand is read by a ribosome, which uses transfer RNA (tRNA) molecules to bring amino acids to the growing polypeptide chain.
