foundation This book is defined for undergraduate students of mathematics to obtain an introduction to quantum mechanical ideas and the associated mathematics without requiring an extensive background in physics This book is focused around the following topics

- 1 The Mathematical Structure of Quantum Mechanics We develop the main mathematical structure of quantum theory in the setting of the accepted postulates of quantum mechanics Dirac's bra ket notation for the required linear algebra aspects will be utilized as well as the mathematical and physical implications arising from the mathematical aspects of self adjoint linear operators with emphasis on the finite dimensional setting
- 2 Dynamics of a Quantum Particle We introduce the Schrodinger equation and discuss its physical meaning and mathematical structure The required partial differential equations theory is elementary and will be developed from scratch
- 3 Measurement Time Evolution Uncertainty and the Harmonic Oscillator This builds on the previously developed mathematics and culminates with a detailed discussion of the quantum mechanical workhorse example the harmonic oscillator
- 4 Quantum Mechanics of Angular Momentum Most of the book is developed in the context of the relatively simple one dimensional quantum systems This topic goes into three dimensions and illustrates how very interesting mathematics can yield novel physical explanations that are unobtainable with classical methods
- 5 The Postulates of Quantum Mechanics Measurement Composite Systems Tensor Products and Entanglement This is the area that most students have heard of quantum entanglement action at a distance and Bell's inequality The mathematics will be at an elementary level except possibly for tensor products which are sadly neglected many linear algebra courses today but which are literally exploding in a variety of current applications
