Mechanisms of Mitotic Chromosome Segregation J. Richard McIntosh, 2018-03-23 This book is a printed edition of the Special Issue Mechanisms of Mitotic Chromosome Segregation that was published in Biology *Molecular Architecture and Dynamics of Meiotic Chromosomes* Ricardo Benavente, Mónica Pradillo, Pedro A. San-Segundo, 2024-03-11 Meiosis is a special type of cell division that allows the generation of haploid gametes and is a key process for sexual reproduction of animals plants and fungi Haploidization requires that meiotic cells undergo a series of unique processes namely pairing synapsis recombination and segregation of homologous chromosomes This involves profound meiosis specific changes in the protein composition and architecture of homologous chromosomes as well as of the condensation and folding of chromatin that require a critical timing and regulation Despite this enormous complexity different organisms may achieve haploidization through common molecular mechanisms A major goal of this article collection is to provide an overview of how meiotic chromosomes and their components are critically involved in the mechanisms of haploidization and how dynamic protein complexes yield important structural intermediates and temporal regulation to this process We welcome submissions of original articles mini reviews and review articles dealing with the composition architecture function and regulation of meiotic chromosomes of animals plants and fungi using microscopic biochemical molecular genetic and or omic techniques

Beysens, G.

Forgacs, 2013-06-29 The 1997 Les Houches workshop on Dynamical Network in Physics and Biology was the third in a series of meetings At the Frontier between Physics and Biology Our objective with these workshops is to create a truly interdisciplinary forum for researchers working on outstanding problems in biology but using different approaches physical chemical or biological Generally speaking the biologists are trained in the particular and motivated by the specifics while in contrast the physicists deal with generic and universal models All agree about the necessity of developing robust models The specific aim of the workshop was to bridge the gap between physics and biology in the particular field of interconnected dynamical networks The proper functioning of a living organism of any complexity requires the coordinated activity of a great number of units Units or in physical terms degrees of freedom that couple to one another typically form networks The physical or biological properties of interconnected networks may drastically differ from those of the individual units the whole is not simply an assembly of its parts as can be demonstrated by the following examples Above a certain critical concentration the metallic islands randomly distributed in an insulating matrix form an interconnected network At this point the macroscopic conductivity of the system becomes finite and the amorphous metal is capable of carrying current The value

of the macroscopic conductivity typically is very different from the conductivity of the individual metallic islands

Stochastic Processes in Cell Biology Paul C. Bressloff, 2022-01-10 This book develops the theory of continuous and discrete stochastic processes within the context of cell biology In the second edition the material has been significantly expanded particularly within the context of nonequilibrium and self organizing systems Given the amount of additional material the book has been divided into two volumes with volume I mainly covering molecular processes and volume II focusing on cellular processes A wide range of biological topics are covered in the new edition including stochastic ion channels and excitable systems molecular motors stochastic gene networks genetic switches and oscillators epigenetics normal and anomalous diffusion in complex cellular environments stochastically gated diffusion active intracellular transport signal transduction cell sensing bacterial chemotaxis intracellular pattern formation cell polarization cell mechanics biological polymers and membranes nuclear structure and dynamics biological condensates molecular aggregation and nucleation cellular length control cell mitosis cell motility cell adhesion cytoneme based morphogenesis bacterial growth and quorum sensing The book also provides a pedagogical introduction to the theory of stochastic and nonequilibrium processes Fokker Planck equations stochastic differential equations stochastic calculus master equations and jump Markov processes birth death processes Poisson processes first passage time problems stochastic hybrid systems queuing and renewal theory narrow capture and escape extreme statistics search processes and stochastic resetting exclusion processes WKB methods large deviation theory path integrals martingales and branching processes numerical methods linear response theory phase separation fluctuation dissipation theorems age structured models and statistical field theory This text is primarily aimed at graduate students and researchers working in mathematical biology statistical and biological physicists and applied mathematicians interested in stochastic modeling Applied probabilists should also find it of interest It provides significant background material in applied mathematics and statistical physics and introduces concepts in stochastic and nonequilibrium processes via motivating biological applications The book is highly illustrated and contains a large number of examples and exercises that further develop the models and ideas in the body of the text It is based on a course that the author has taught at the University of Utah for many years **The Chromosomes** Michael James Denham White, 1973 Biology and
