Polymer Membranes for Fuel Cells Javaid Zaidi, Takeshi Matsuura, 2008-10-27 From the late 1960s perfluorosulfonic acid (PFSA) ionomers have dominated the PEM fuel cell industry as the membrane material of choice. The gold standard amongst the many variations that exist today has been and to a great extent still is DuPont's Nafion family of materials. However, there is significant concern in the industry that these materials will not meet the cost, performance, and durability requirements necessary to drive commercialization in key market segments, especially automotive. Indeed, Honda has already put fuel cell vehicles in the hands of real end users that have home-grown fuel cell stack technology incorporating hydrocarbon-based ionomers.

Polymer Membranes in Fuel Cells takes an in-depth look at the new chemistries and membrane technologies that have been developed over the years to address the concerns associated with the materials currently in use. Unlike the PFSA which were originally developed for the chlor-alkali industry, the more recent hydrocarbon and composite materials have been developed to meet the specific requirements of PEM Fuel Cells. Having said this, most of the work has been based on derivatives of known polymers such as poly(ether ether ketone) to ensure that the critical requirement of low cost is met. More aggressive operational requirements have also spurred the development of new materials. For example, the need for operation at higher temperature under low relative humidity has spawned the creation of a plethora of new polymers with potential application in PEM Fuel Cells.
