Mazda Premacy, 2002 **Modeling and Control of Active Engine Mounts** Ahmed Murgab Mohammed Mahil, 2014 The automobile industry has developed significantly through years and producing fuel efficient cars became the most important priority for automobile manufacturers and that will affect the cars weight to make them lighter using composites and alloys that is lighter than steel and have a better strength to weight ratio and therefore have a low fuel consumption and by utilizing efficient engine mounts powerful engines can be installed into light vehicles yet such mounts are seldom and the introduction of more powerful engines to lighter cars will cause more vibrations that will not likely be damped by the traditional mounts specifically the low frequency vibrations and that will affect the passengers comfort and health in order to remedy this quagmire active engine mounts were introduced the typical active engine mount consists of a rubber passive mount and a force actuator that will be activated at certain frequencies and generate a damping force approximately equal to the disturbance force thus these systems will reduce the amount of vibrations that reaches the passenger cabin more than the passive and semi active engine mount systems many control techniques has been investigated in order to enhance the performance of the active mounting yet most of the control techniques has been implemented on unrealistic models and it is seldom to find any realistic model of active engine mount In this dissertation classical and modern controllers has been introduced on three different models starting from two degree of freedom unrealistic model and then a moderately realistic four degree of freedom model and finally a realistic six degree of freedom model two control techniques were implemented

on the different systems namely PID proportional integral derivative LQR linear quadratic regulator respectively then comparison was done between their simulation results and performance assessment for the controllers simulation results was conducted and showed a significant enhancement in isolating the vibrations of the engine from the car body

Design and Development of Active and Semi-active Engine Mounts Hossein Mansour, 2010

Vibration isolation in the engine compartment is a challenging design problem for all transportation means particularly in the automotive industry to attain better ride quality improved road handling and longer engine parts life Given the emergence of new vehicles with more stringent performance characteristics engine vibration isolation has become a more demanding issue This thesis focuses on the modelling development and experimental analysis of two active and semi active engine mounts designed specifically to address the isolation problem of Variable Displacement Engines VDE It has been shown however that the designed mounts are flexible enough to fulfil the isolation requirements of other engine types as well Both proposed mounts are made by adding retrofitable parts to the conventionally available hydraulic engine mounts The promising performance of the fabricated mounts in addition to their minimal cost fail safety and low energy consumption makes them appealing solutions for the auto industry
