Working Fluid Selection for Organic Rankine Cycle and Other Related Cycles Attila R. Imre, 2020-06-16 The world's energy demand is still growing partly due to the rising population partly to increasing personal needs This growing demand has to be met without increasing or preferably by decreasing the environmental impact One of the ways to do so is the use of existing low temperature heat sources for producing electricity such as using power plants based on the organic Rankine cycle ORC In ORC power plants instead of the traditional steam the vapor of organic materials with low boiling points is used to turn heat to work and subsequently to electricity These units are usually less efficient than steam based plants therefore they should be optimized to be technically and economically feasible The selection of working fluid for a given heat source is crucial a particular working fluid might be suitable to harvest energy from a 90 geothermal well but would show disappointing performance for well with a 80 head temperature The ORC working fluid for a given heat source is usually selected from a handful of existing fluids by trial and error methods in this collection we demonstrate a more systematic method based on physical and chemical criteria

Handbook of Alkali-Activated Cements, Mortars and Concretes F.

Pacheco-Torgal,Joao Labrincha,C Leonelli,A Palomo,P Chindaprasit,2014-11-20 This book provides an updated state of the art review on new developments in alkali activation The main binder of concrete Portland cement represents almost 80% of the total CO₂ emissions of concrete which are about 6 to 7% of the Planet s total CO₂ emissions This is particularly serious in the current context of climate change and it could get even worse because the demand for Portland cement is expected to increase by almost 200% by 2050 from 2010 levels reaching 6000 million tons year Alkali activated binders represent an alternative to Portland cement having higher durability and a lower CO₂ footprint Reviews the chemistry mix design manufacture and properties of alkali activated cement based concrete binders Considers performance in adverse environmental conditions Offers equal emphasis on the science behind the technology and its use in civil engineering

Novel Compounds from Chemistry to Druggable Candidates Peter Rose, Yi Zhun Zhu ,Jawad Nasim,2024-09-30 In the field of drug development the exploitation of chemical platforms for the identification of novel druggable molecules has become common place in many research laboratories In recent years the characterisation of novel bioactives that often share chemical properties commonly found in many nature products or molecules that are critical in cell signalling systems has gained much attention Synthetic routes of production and allied platforms in the characterisation of druggable entities continues to drive advances in this field The multidisciplinary nature of the research has led to the design and refinement of natural products like drug candidates and in the synthesis of biological mimetics they function as cellular antioxidants as enzymes mimetics or as novel molecules that have the capacity to release signalling molecules in tissues

Mobile Genetic Elements in Cellular Differentiation, Genome Stability, and Cancer Tammy A. Morrish, Jose Luis García Pérez, 2018-01-16 The human genome as with the genome of most organisms is comprised of various types of mobile genetic element derived repeats Mobile genetic elements that mobilize by an RNA intermediate include both autonomous and non autonomous retrotransposons and mobilize by a copy and paste mechanism that relies of the presence of a functional reverse transcriptase activity The extent to which these different types of elements are actively mobilizing varies among organisms as revealed with the advent of Next Generation DNA sequencing NGS To understand the normal and aberrant mechanisms that impact the mobility of these elements requires a more extensive understanding of how these elements interact with molecular pathways of the cell including DNA repair recombination and chromatin In addition epigenetic based mechanisms can also influence the mobility of these elements likely by transcriptional activation or repression in certain cell types Studies regarding how mobile genetic elements interface and evolve with these pathways will rely on genomic studies from various model organisms In addition the mechanistic details of how these elements are regulated will continue to be elucidated with the use of genetic biochemical molecular cellular and bioinformatic approaches Remarkably the current understanding regarding the biology of these elements in the human genome suggests these elements may impact developmental biology including cellular differentiation neuronal development and immune function

Thus aberrant changes in these molecular pathways may also impact disease including neuronal degeneration autoimmunity and cancer
