DC Technology in Utility Grids Sedigheh Rabiee, Marco Cupelli, Mohsen Ferdowsi, Hanno Stagge, Matthias Heidemann, Robert Möller, 2021-12-17 The assembly of this study started in 2013 during the preparation of the foundation of the Flexible Electrical Networks FEN Research Campus an institution supported by the German Federal Ministry of Education and Science concentrating on DC technology in power grids as an enabler for the energy transition It reflects the state of the art and research needs of DC technology against the background of application in public grids up until the year 2015 Topics as components control management and automation high medium and low voltage grid concepts as well as social dimensions economics and impact on living beings are considered After substantial editorial effort its first public edition has become ready now The aim of FEN is to investigate and to develop flexible power grids Such grid will safeguard the future energy supply with a high share of fluctuating and decentralized renewable energy sources At the same time these grids will enable a reliable and affordable energy supply in the future The objective is to provide new technologies and concepts for the security and quality of the energy supply in the transmission and distribution grids To pursue this goal the use of direct current DC technology based on power electronics automation and communication technologies plays an important role Although DC technology is not yet established as a standard technology in the public electrical power supply system its high potential has been widely recognized The use of DC is an enabler to make the future energy supply system more economical than a system based on alternating current AC because of its superior properties in handling distributed and fluctuation power generation Indeed DC connections are already the most cost efficient solution in cases of very high power long distance point to point transmission of electricity or

via submarine cables The objective of the FEN Research Campus is now to achieve and demonstrate feasibility of DC as a standard solution for future electrical grids as described in this study

that back up the theory or techniques presented. The authors set out information on mathematical modelling and equations in appendices rather than integrated in the main text. This unique approach distinguishes it from other text books on Electrical Power Systems and makes the resource highly accessible for undergraduate students and readers without a technical background directly related to power engineering. After laying out the basics for a steady state analysis of the three phase power system, the book examines generation, transmission, distribution and utilization of electric energy, wind energy, solar energy and hydro power, power system protection and circuit breakers, power system control and operation, the organization of electricity markets and the changes currently taking place, system blackouts, future developments in power systems, HVDC connections and smart grids. The book is supplemented by a companion website from which teaching materials can be downloaded: <https://www.wiley.com/legacy/wileychi/powersystem/material.html>

Intelligent Electrical Protection in Traditional Networks and Smart Grids Salman Rezaei, 2025-02-20. The main objective of this book is to enlighten readers on the automatic protection control and monitoring of power systems. The focus is on the development of intelligent protective algorithms to combat ferroresonance and Sub Synchronous Resonance (SSR) in both traditional networks and smart grids. Initially, the book covers the theoretical aspects of ferroresonance, SSR and protective relays. It then discusses the occurrence of ferroresonance and SSR in the grid and the impact of these phenomena on the operation of electrical components and a variety of protective relays. Intelligent algorithms are designed and tested for various types of protective relays. The book also introduces a power automation system known as the Universal Protection Control and Power Energy Management Centre (UPCPEMC). This SCADA based centre includes hardware components and new software for simulation, analysis, protection control and power system component design. Additionally, it includes power and energy management programs that are

suitable for use in both traditional networks and smart grids
