

## Chapter 8 Microbial Genetics

- Big picture
  - Mutations can be caused by base substitutions or frameshift mutations
- Structure and Function of the Genetic Material
  - Genetics
    - The study of genes, how they carry information, how information is expressed, and how genes are replicated
  - Chromosomes
    - Structures containing DNA that physically carry hereditary information; the chromosomes contain genes
  - Genes
    - Segments of DNA that encode functional products, usually proteins
  - Genome
    - All the genetic information in a cell
  - The genetic code is a set of rules that determines how a nucleotide sequence is converted to an amino acid sequence of a protein
  - Central dogma
    - DNA → RNA → Protein
- Genotype and Phenotype
  - Genotype
    - The genetic makeup of an organism (represents potential expression)
  - Phenotype
    - Expression of the genes (represents actual expression)
- DNA and Chromosomes
  - Bacteria usually have single circular chromosomes made of DNA and associated proteins
  - The chromosome is looped and folded and attached at one or several points to the plasma membrane
  - DNA of E. coli has about 4.6 million base pairs and is about 1mm long (1000x longer than the entire cell).
    - Chromosomes take up only about 10% of the cell's volume because the DNA is twisted or supercoiled
- Organization
  - The entire genome does not consist of back-to-back genes. Noncoding regions, called short tandem repeats, occur in most genomes. (Ex, E. Coli)
  - Short tandem repeats (STRs)
    - Repeating sequences of noncoding DNA
  - Can be used in DNA Fingerprinting
- Genomics
  - Complete base sequences of chromosomes can be determined
  - Computers are used to search for open reading frames (regions of DNA likely to encode a protein)
