Computational Fluid and Solid Mechanics K.J. Bathe, 2001-05-21 The MIT mission to bring together Industry and Academia and to nurture the next generation in computational mechanics is of great importance to reach the new level of mathematical modeling and numerical solution and to provide an exciting research environment for the next generation in computational mechanics Mathematical modeling and numerical solution is today firmly established in science and engineering Research conducted in almost all branches of scientific investigations and the design of systems in practically all disciplines of engineering can not be pursued effectively without frequently intensive analysis based on numerical computations The world we live in has been classified by the human mind for descriptive and analysis purposes to consist of fluids and solids continua and molecules and the analyses of fluids and solids at the continuum and molecular scales have traditionally been pursued separately Fundamentally however there are only molecules and particles for any material that interact on the microscopic and macroscopic scales Therefore to unify the analysis of physical systems and to reach a deeper understanding of the behavior of nature in scientific investigations and of the behavior of designs in engineering endeavors a new level of analysis is necessary This new level of mathematical modeling and numerical solution does not merely involve the analysis of a single medium but must encompass the solution of multi physics problems involving fluids solids and their

interactions involving multi scale phenomena from the molecular to the macroscopic scales and must include uncertainties in the given data and the solution results Nature does not distinguish between fluids and solids and does not ever repeat itself exactly This new level of analysis must also include in engineering the effective optimization of systems and the modeling and analysis of complete life spans of engineering products from design to fabrication to possibly multiple repairs to end of service

This IMA Volume in Mathematics and its Applications COMPUTATIONAL FLUID DYNAMICS AND REACTING GAS FLOWS is in part the proceedings of a workshop which was an integral part of the 1986 87 IMA program on SCIENTIFIC COMPUTATION We are grateful to the Scientific Committee Bjorn Engquist Chairman Roland Glowinski Mitchell Luskin and Andrew Majda for planning and implementing an exciting and stimulating year long program We especially thank the Workshop Organizers Bjorn Engquist Mitchell Luskin and Andrew Majda for organizing a workshop which brought together many of the leading researchers in the area of computational fluid dynamics George R Sell Hans Weinberger

PREFACE

Computational fluid dynamics has always been of central importance in scientific computing It is also a field which clearly displays the essential theme of interaction between mathematics physics and computer science Therefore it was natural for the first workshop of the 1986 87 program on scientific computing at the Institute for Mathematics and Its Applications to concentrate on computational fluid dynamics In the workshop more traditional fields were mixed with fields of emerging importance such as reacting gas flows and non Newtonian flows The workshop was marked by a high level of interaction and discussion among researchers representing varied schools of thought and countries

Hydrodynamics Harry Schulz, André Simoes, Raquel Lobosco, 2011-10-26

The constant evolution of the calculation capacity of the modern computers implies in a permanent effort to adjust the existing numerical codes or to create new codes following new points of view aiming to adequately simulate fluid flows and the related transport of physical properties Additionally the continuous improving of laboratory devices and equipment which allow to record and measure fluid flows with a higher degree of details induces to elaborate specific experiments in order to shed light in unsolved aspects of the phenomena related to these flows This volume presents conclusions about different aspects of calculated and observed flows discussing the tools used in the analyses It contains eighteen chapters organized in four sections 1 Smoothed Spheres 2 Models and Codes in Fluid Dynamics 3 Complex Hydraulic Engineering Applications 4 Hydrodynamics and Heat Mass Transfer The chapters present results directed to the optimization of the methods and tools of Hydrodynamics
