N. Reynolds,MCDONNELL CO ST LOUIS MO.,1966 The purpose of the space report is to familiarize personnel with the operation and service instructions of the Coolant System Flush and Purge Unit The report STDR presents a description of the unit its controls and functions servicing instructions for preventive maintenance and applicable safety precautions associated with its operation Author Comparison of Bench Test Methods to Evaluate Heavy Duty Coolant Thermal Stability R. Doug Hudgens,Yu-Sen Chen,Edward R. Eaton,2007 The past 10 to 15 years have seen a dramatic change in heavy duty coolants and cooling system maintenance practices Controversy exists about the relative merits of newer organic acid OAT coolants and more conventional products especially in the area of thermal stability Coolant life has been extended from two years 240 K miles to at least five years 600 K miles It is not uncommon for the same charge of coolant to remain in the cooling system until engine rebuild Further there has been an equally significant increase in the coolant service intervals Reinhibition of the coolant was once tied to the oil change interval

at 15 to 25 K miles Now this additive addition has been extended in many cases to one year 150 K miles to two years 300 K miles Along with these dramatic increases in coolant life and service interval strategies to reduce exhaust emissions such as EGR have increased and will continue to increase coolant temperatures Sorting out coolant stability issues in the field is both expensive and time consuming Further it is very difficult to control a field test so as to obtain reliable data In this environment a bench test method that can quickly simulate high temperature severe field service conditions is of vital importance This paper compares four bench test methods as far as their ability to sort out thermal stability issues based on results from five coolants representing different additive packages and glycol qualities *Screening Study to Identify Phase Change Coolants for Portable Life Support Systems* Sandra S. Donovan, HORIZONS RESEARCH INC CLEVELAND OHIO., 1977 A literature search to identify coolant candidates to be considered for replacing the ice water system in a portable life support unit led to the following considerations CO₂ an NH₃ CO₂ mixture and a salt such as potassium acid fluoride incorporated into ice In the CO₂ system solid CO₂ will sublime and the resultant gases warm to 4 C then be expelled from the suit The heat absorption for this process is 153 0 Kcal kg To achieve 504 Kcal 2000 Btu of cooling 3 3 Kg 7 3 lbs of CO₂ is needed This is an 83% improvement over the heat absorption of ice melting and warming to 4 C or a 45% reduction in the weight of ice needed The CO₂ system appears to be completely safe In the NH₃ CO₂ system the CO₂ will sublime the NH₃ vaporize and the resultant gases warm to 4 C then with mixing be expelled from the suit This system might be flammable so should be examined in the laboratory The heat absorption for this system is an impressive 198 5 Kcal kg for an 0 8 mole ratio of NH₃ to CO₂ To achieve 504 Kcal 2000 Btu of cooling 2 5 Kg 5 6 lbs of total coolant is needed This is a 137% improvement over the heat absorption of ice melting and warming to 4 C or a 58% reduction in the weight of ice needed In the potassium acid fluoride ice system the heat of solution of the salt is added to the heat of fusion of ice Over the temperature range of about 15 to 5 C this system yield 121 Kcal kg To achieve 504 Kcal 2000 Btu of cooling 4 12 Kg 9 2 lbs of total coolant is needed This is a 45% improvement over the ice alone system **An experimental examination of the reduction of heat flux caused by a coolant phase change in a porous matrix** Robert S.
