*Focus On: 100 Most Popular Compact Cars* Wikipedia contributors, **Business World**, 2003 **Some mechanical Problems in relation to high speed Diesel engines**, 1935 **Technical Problems Associated with Diesel Fuels in Interstate Coach Operation** W. A. Duvall, 1954 The quality and availability of diesel fuel has so nearly kept pace with the development of the diesel engine in interstate coach service that one would almost be inclined to say that there were no problems When one thinks back to the early years of the diesel engine in this type of service it is impossible not to feel that the progress in the development of the two cycle engine and the evolution of specifications leading to present day fuels indicate that the development of the two must be closely related Stuck valves broken and burned pistons and stuck and broken rings were some of the early problems most closely related to fuel Of course it is impossible to separate lubrication problems from the fuel in this type of failure In fact it is impossible to say that they were not sometimes related to the mechanical failures that so often occurred during the same period and which because of their nature could not be separated or definitely identified as being caused purely by one thing or another In any case the interstate coach services did elect to stay with the diesel engine through these early years in spite of the problems attendant upon a nonmilitary operation in the midst of a major war During those years the oil suppliers always managed to supply the needs of these companies not only for diesel fuel but for gasoline as well they supplied the best quality fuel that was at their command while keeping in mind of course that winning the war was the primary objective Report of the Diesel Fuel Task Force California. Diesel Fuel Task Force, 1994 Distribution and Storage Problems with Diesel Fuels W. P. Lakin, C. C. Moore, 1954 Last year over 6 billion gallons of diesel fuel were required to satisfy the domestic United States demand It is estimated that at least 8 million separate product movements were required to get this fuel into the tanks of the ultimate consumers In fact the actual number of product movements is probably much higher For example in many cases heating oils and diesel fuels are identical products and move through the same distribution systems Heating oil sales amount to about 15 billion gallons and certainly require at least an additional 15 million product deliveries These estimates point up the complexity of the problem of distributing diesel fuels In some cases where the system is relatively straightforward the fuel is carried in large volume carriers railroad tank cars or tank wagons directly from the refinery to the supply tanks of the consumer In many other cases the initial delivery is made by tank ship to a marine terminal from this terminal the fuel is carried by tank car or tank wagon to a bulk plant from the bulk plant the fuel is transported to service stations and from the service stations it is sold in small quantities for use on the road All of these shipments and product movements must be handled in such a way as to minimize inventories and also to minimize the number of tanks and the number of pieces of mobile equipment required The optimum choice must be made between two types of systems 1 delivery of large volumes requiring large scale tankage and long hauls and 2 a large number of shorthaul deliveries of small volumes into smaller scale tankage Furthermore it is not a case of

handling one single product but a multiplicity of products Generally at least two or three diesel fuels are involved and in many cases a separate delivery system for heating oil is also required This vast number of product movements and the number of times that each product is handled are of great importance since diesel fuels have very limited tolerance as regards contamination Everyone is thoroughly familiar with the fact that dirt or abrasive materials of all types must be excluded from diesel fuel oil However not as much thought has been given to the fact that there are many other types of contamination which can adversely affect the performance of diesel fuels These contaminants include water gasoline other fuel oils in fact almost anything else Unfortunately a great many people take all too seriously statements regarding the diesel engine's ability to burn anything that can be pumped They do not realize that this statement is figurative rather than literal as far as the vast majority of diesel equipment is concerned Where Diesel Engines Have Solved Power Problems Nordberg Manufacturing Company,1928 *Technical Problems Associated with Diesel Fuels in Contractors' Equipment* J. W. Vollentine,1954 The contractors in this country generally have no operating conditions with diesel fuels which can be considered to constitute a field problem Occasionally however annoying incidents occur which are the result of fuel characteristics or unsatisfactory fuel handling The contractor is interested primarily in the following items which are in whole or in part affected by diesel fuels 1 Engine starting 2 Fuel handling 3 Fuel injection equipment wear 4 Piston ring and cylinder liner wear 5 Engine maintenance and 6 Fuel cost The fuel characteristics which influence these items of operation will be considered here as well as some characteristics that are considered to be relatively unimportant **Operating Problems** Diesel Engine Users' Association,1952 **Technical Problems Associated with Diesel Fuels in Contractors Equipment - to be Presented February 17, 1954, ASTM Symposium on Diesel Fuels, Philadelphia, PA** J. W. Vollentine,1954
