Introduction to Intelligent Systems in Traffic and Transportation Ana L.C. Bazzan, Franziska Klügl, 2022-05-31

Urban mobility is not only one of the pillars of modern economic systems but also a key issue in the quest for equality of opportunity once it can improve access to other services. Currently, however, there are a number of negative issues related to traffic, especially in mega cities, such as economical issues, cost of opportunity caused by delays, environmental externalities related to emissions of pollutants, and social traffic accidents. Solutions to these issues are more and more closely tied to information and communication technology. Indeed, a search in the technical literature using the keyword urban traffic to filter out articles on data network traffic retrieved the following number of articles as of December 3, 2013: 9,443 ACM Digital Library, 26,054 Scopus, and 1,730,000 Google Scholar. Moreover, articles listed in the ACM query relate to conferences as diverse as MobiCom, CHI, PADS, and AAMAS. This means that there is a big and diverse community of computer scientists and computer engineers who tackle research that is connected to the development of intelligent traffic and transportation systems. It is also possible to see that this community is growing and that research projects are getting more and more interdisciplinary. To foster the cooperation among the involved communities, this book aims at giving a broad introduction into the basic but relevant concepts related to transportation systems, targeting researchers and practitioners from computer science and information technology. In addition, the second part of the book gives a panorama of some of the most exciting and newest technologies originating in computer science and computer engineering that are now being employed in projects related to car-to-car communication, interconnected vehicles, car navigation, platooning, crowd sensing, and sensor networks, among others. This material will also be of interest to engineers and researchers from the traffic and transportation community.

Understanding Traffic Systems Michael A.P. Taylor, Peter W. Bonsall, 2017-03-02. Road traffic and its impacts affect all aspects of modern life, leisure, and industry, with safety, congestion, and pollution being of greatest public concern. Transport planning increasingly emphasises travel demand management (TDM) and traffic calming, aided by dynamic, lower cost data from Intelligent Transport Systems (ITS) to enable real time monitoring, control, and traveller information. This second edition of a highly successful work has been fully updated since its first publication in 1996 to reflect developments in technology available to the traffic analyst and in the social, ecological, and economic environment. New sections are included on shockwaves, data capture without surveys, traffic incidents, delay estimation, off-line use of on-line data, environmental sensitivity, and controlled crash tests. The authors introduce and demonstrate techniques with which the analyst, engineer, or planner can examine traffic problems. The underlying theme is that proper understanding of traffic systems performance and traffic problems can only come from the intelligent processing, refinement, appraisal, and evaluation of traffic data. Arranged in five parts, the book offers an integrated approach to tackling road traffic problems: How to gain information and understanding about traffic; The theories of traffic flow; The principles of good survey planning and management; Specific

types of traffic studies Analytical techniques for transforming raw data into useful information Understanding Traffic Systems provides cogent insights into the techniques of traffic data collection and analysis the application of traffic theory and the role of data in analysis and decision making Its breadth and use of examples from several countries make it a useful reference text for students and researchers as well as an essential tool for practising traffic engineers and planners

Applications of Learning Classifier Systems Larry Bull,2012-08-13 The field called Learning Classifier Systems is populated with romantics Why shouldn t it be possible for computer programs to adapt learn and develop while interacting with their environments In particular why not systems that like organic populations contain competing perhaps cooperating entities evolving together John Holland was one of the earliest scientists with this vision at a time when so called artificial intelligence was in its infancy and mainly concerned with preprogrammed systems that didn t learn that like organisms had sensors took Instead Holland envisaged systems actions and had rich self generated internal structure and processing In so doing he foresaw and his work prefigured such present day domains as reinforcement learning and embedded agents that are now displacing the older standard Af One focus was what Holland called classifier systems sets of competing rule like classifiers each a hypothesis as to how best to react to some aspect of the environment or to another rule The system embracing such a rule popu lation would explore its available actions and responses rewarding and rating the active rules accordingly Then good classifiers would be selected and re produced mutated and even crossed a la Darwin and genetics steadily and reliably increasing the system s ability to cope
