Physico-Chemical Control of Cell Function Cesare Gargioli,Giancarlo Forte,Alberto Rainer,2019-10-17 Extracellular Matrix ECM has been considered for a long time merely a scaffold sustaining cell and tissue function Despite this simplistic view shared by many nowadays ECM and their mechanic physical and chemical characteristic acquired a progressive larger role actively regulating cell life survival proliferation gene

expression and differentiation The interplay between cells and the ECM is continuously controlled at the cell level in a dynamic way While cells synthesize the raw components of the ECM this in turn impacts on cell function by providing chemical topographical and mechanical hints Such stimuli have been proven to control several aspects of cell function including survival proliferation differentiation and migration The molecular pathways activated by cells in response to the physical cues arising from the ECM are being disclosed and thus the possibility to control cell function through materials design is becoming more realistic Current in vitro protocols relying in 2D cell culture system entail reductionist approaches to the complexity of cell ECM interaction and result in cells rapidly losing their distinctive functions in culture Understanding and replicating the 3D microenvironmental cues affecting cell function appears as a mandatory requirement for the development of next generation biomaterials as well as for the establishment of more physiologically relevant and predictive in vitro models of diseases Such an effort will require a multidisciplinary approach at the convergence of biophysics biology nanotechnology and bioengineering

Surface and Interfacial Aspects of Cell Adhesion Alain Carre,Kash L. Mittal,2011-01-19 Cell adhesion comes into play in almost all domains of life The range of situations in which it occurs involving organisms living tissues microorganisms or single cells is endless Cell adhesion is involved in the binding of a cell to a surface extracellular matrix or another cell using cell adhesion molecules It is crucial in the formation

Regulatory RNAs in the Nervous System, 2nd Edition Tommaso Pizzorusso,Alessandro Cellerino,Laure Bally-Cuif,2018-11-13 Until about a decade ago the non coding part of the genome was considered without function RNA sequencing studies have shown however that a considerable part of the non coding genome is transcribed and that these non coding RNAs nc RNAs can regulate gene expression Almost on weekly basis new findings reveal the regulatory role of nc RNAs exert in many biological processes Overall these studies are making increasingly clear that both in model organisms and in humans complexity is not a function of the number of protein coding genes but results from the possibility of using combinations of genetic programs and controlling their spatial and temporal regulation during development senescence and in disease by regulatory RNAs This has generated a novel picture of gene regulatory networks where regulatory nc RNAs represent novel layers of regulation Particularly well characterized is the role

of microRNAs miRNAs small nc RNAs that bind to mRNAs and regulate gene expression after transcription This message is particularly clear in the nervous system where miRNAs have been involved in regulating cellular pathways controlling fundamental functions during development synaptic plasticity and in neurodegenerative disease It has also been shown that neuronal miRNAs are tightly regulated by electrical activity at the level of transcription biogenesis stability and specifically targeted to dendrites and synapses Dereglulation of expression of miRNAs is proposed not only as potential disease biomarker but it has been implicated directly in the pathogenesis of complex neurodegenerative disease This so called RNA revolution also lead to the exploitation of RNA interference and the development of related tools as potential treatment of a vast array of CNS disease that could benefit from regulation of disease associated genes In spite of these advancements the relatively young age of this field together with the inherent high molecular complexity of RNA regulation of biological processes have somewhat hindered its communication to the whole of the neuroscience community This Research Topic aims at improving this aspect by putting around the same virtual table scientists covering aspects ranging from basic molecular mechanisms of regulatory RNAs in the nervous system to the analysis of the role of specific regulatory RNAs in neurobiological processes of development plasticity and aging Furthermore we included papers analyzing the role of regulatory RNAs in disease models from neuromuscular to higher cognitive functions and more technically oriented papers dealing with new methodologies to study regulatory RNA biology and its translational potential

Oligodendrocyte Physiology and Pathology Function

Markus Kipp,2021-01-06 The adult vertebrate central nervous system mainly consists of neurons astrocytes microglia cells and oligodendrocytes Oligodendrocytes the myelin forming cells of the CNS are subjected to cell stress and subsequent death in a number of metabolic or inflammatory disorders among which multiple sclerosis MS is included This disease is associated with the development of large demyelinated plaques oligodendrocyte destruction and axonal degeneration paralleled by the activation of astrocytes and microglia as well as the recruitment of peripheral immune cells to the site of tissue injury Of note viable oligodendrocytes and an intact myelin sheath are indispensable for neuronal health For example it has been shown that oligodendrocytes provide nutritional support to neurons fast axonal transport depends on proper oligodendrocyte function and mice deficient in mature myelin proteins eventually display severe neurodegeneration This Special Issue contains a collection of highly relevant primary research articles as well as review articles focusing on the development physiology and pathology of the oligodendrocyte axon myelin unit
