Bioactive Peptides Produced by Limited Proteolysis Antonio Camargo, Emer Ferro, 2012-05-01 Proteins are considered supremely important for the organization survival and functioning of living organisms They were considered stable and static molecules until the early 1940s when Rudolph Schoenheimer demonstrated that proteins exist in a constant dynamic process of synthesis and degradation proteostasis absolutely essential for life Since then general and limited protein degradation became some of the most fascinating aspects of biological sciences This book is focused on a particular aspect of protein degradation namely limited proteolysis which gives rise to bioactive peptides as a result of the enzymatic action of proteinases and peptidases which are enzymes that hydrolyze specific peptide bonds of proteins and peptides respectively In a broad sense bioactive peptides are any fragment of endogenous or exogenous proteins able to elicit either physiological or pathological activities Here we aim at presenting to the readers that bioactive

peptides are not merely produced through random processes during protein degradation but rather through a well organized enzymatic process that is deeply integrated in the homeostatic processes of living organisms Brian Luke
