Freight And Air Quality Handbook:

Freight and Air Quality Handbook U. S. Department Transportation, 2015-01-04 The ability of our nation's transportation system to provide for and maintain the efficient movement of freight is important to the continuing economic health of the United States. U.S. domestic freight tonnage is anticipated to approximately double and international freight tonnage expected to nearly triple by 2035. This has led to a growing need to find new ways to address air quality concerns and greenhouse gas emissions associated with freight movements. Diesel exhaust from freight vehicles is a primary source of PM_{2.5} air toxic contaminants and NO_x emissions, one precursor to ozone, all of which have potential health implications. Freight emissions comprise close to one third of U.S. transportation greenhouse gas emissions and have grown by more than 50 percent since 1990. As a result, there is a steadily increasing number of challenges faced by both freight and air quality planners as they attempt to simultaneously meet the growing demand for freight while improving environmental outcomes. They must meet the requirements of new and varied initiatives being put into place across the nation as states and regions grapple with air quality issues and emissions budgets, understand how to integrate emerging equipment and infrastructure technologies, look for ways to make the system more efficient and identify new funding sources for these activities. A wide range of strategies is available to mitigate these freight and air quality challenges, ranging from technological strategies such as engine retrofits and alternative fuels to operations strategies such as congestion mitigation and idling reduction. Not only must planners identify viable mitigation strategies, they also must navigate the myriad transportation and environmental funding programs to identify ones that could be applicable to their project. The Federal Highway Administration's FHWA Office of Freight Management and Operations, in cooperation with the Office of Natural and Human Environment, developed this handbook as a resource for states, metropolitan planning organizations (MPO), FHWA, and other public and private sector organizations to use in developing solutions to these challenges. This handbook provides the background needed to understand how freight contributes to air quality issues, describes strategies to mitigate those freight-related pollutant emissions and improve air quality, and identifies funding and financing tools available for freight-related air quality projects, e.g., freight projects designed to reduce the emissions of air pollutants. It is designed to be used by all involved in the identification, financing, and delivery of freight-related air quality projects, whether approaching from a freight or an air quality perspective.

Handbook on Applying Environmental Benchmarking in Freight Transportation Laurence O'Rourke, 2012 NCFRP Report 21. *Handbook on Applying Environmental Benchmarking in Freight Transportation* identifies and evaluates approaches that can be used by public and private entities to estimate, monitor, and reduce freight emissions and impacts across the supply chain by examining how benchmarking can be used as a management tool in the freight and logistics industry to promote environmental performance. The handbook provides a step-by-step overview of the benchmarking process and describes a framework for applying this process to freight carriers, shippers, and freight hubs.
