Irritable bowel syndrome IBS is a chronic visceral pain disorder with female predominance characterized by recurrent abdominal pain and disturbed bowel habits in the absence of an identifiable organic cause This prevalent and debilitating disease which accounts for a substantial economic and individual burden lacks exact diagnostic tools and effective treatment since its pathophysiology remains uncertain The bidirectional and multilayered brain gut axis is a well established disease model however the interactions between central and peripheral mechanisms along the brain gut axis remain incompletely understood One of the well described triggering factors yet accounting for only a fraction of IBS prevalence is bacterial gastroenteritis that affects mucosal barrier function Altered gut microbiota composition as well as disturbed intestinal mucosal barrier function and its neuroimmune regulation have been reported in IBS however the impact of live bacteria neither commensal nor pathogenic on intestinal barrier has not been studied yet Furthermore abnormal central processing of visceral sensations and psychological factors such as maladaptive coping have previously been suggested as centrally mediated pathophysiological mechanisms of importance in IBS Brain imaging studies have demonstrated an imbalance in descending pain modulatory networks and alterations in brain regions associated with interoceptive awareness and pain processing and modulation particularly in anterior insula aINS although biochemical changes putatively underlying these central alterations remain poorly understood Most importantly however possible associations between these documented changes on central and peripheral levels which may as complex interactions contribute to disease onset and chronification of symptoms are widely unknown This thesis aimed to investigate the peripheral and central mechanisms in women with IBS compared to female healthy controls HC and to explore possible mutual associations between these mechanisms In Paper I we studied paracellular permeability and passage of live bacteria both commensal and pathogenic through colonic biopsies mounted in Ussing chambers We explored the regulation of the mucosal barrier function by mast cells and the neuropeptide vasoactive intestinal polypeptide VIP as well as a correlation between mucosal permeability and gastrointestinal and psychological symptoms We observed increased paracellular permeability and the passage of commensal and pathogenic live bacteria in patients with IBS compared with HC which was diminished by blocking the VIP receptors as well as after stabilizing mast cells in both groups Moreover higher paracellular permeability was associated with less somatic and psychological symptoms in patients In Paper II we aimed to determine the association between colonic mucosa paracellular permeability and structural and resting state functional brain connectivity We demonstrated different patterns of associations between mucosa permeability and functional and structural brain connectivity in IBS patients compared to HC Specifically lower paracellular permeability in IBS similar to the levels detected in HC was associated with more severe IBS symptoms and increased functional and structural connectivity between intrinsic brain resting state network and descending

pain modulation brain regions Our findings further suggested that this association between mucosa permeability and functional brain connectivity was mainly mediated by coping strategies In Paper III we investigated putative alterations in excitatory and inhibitory neurotransmission of aINS as the brain s key node of the salience network crucially involved in cognitive control in IBS patients relative to HC and addressed possible connections with both symptoms and psychological factors We found decreased concentrations of the excitatory neurotransmitter Glx in bilateral aINS in IBS patients compared to HC while inhibitory neurotransmitter GABA levels were comparable Further we demonstrated hemisphere specific associations between abdominal pain coping and aINS excitatory neurotransmitter concentration In conclusion this thesis broadens the knowledge on peripheral and central mechanisms in IBS and presents novel findings that bring together the ends of brain gut axis Our results depict association between mucosal permeability IBS symptoms and functional and structural connectivity engaging brain regions involved in emotion and pain modulation as well as underlying neurotransmitter alterations
