

Isaac Newton's 3 Laws of Motion

Sir Isaac Newton (1642-1727) was an English physicist and mathematician. Before the age of 30 he formulated the laws of motion and invented calculus. Much of our modern science is based on Newton's

Newton's Laws of Motion

Law One – Law of Inertia

An object at rest will stay at rest unless acted on by an unbalanced force.
 An object in motion will stay in motion unless acted upon by an unbalanced force.

OR

Things keep moving or stay at rest, unless a net force acts upon them.

Law Two – $F = ma$

The acceleration of an object is proportional to the force acting on it and inversely proportional to its mass.

OR

Force causes acceleration, while mass resists acceleration

Law Three –

Law of Equal and Opposite Forces.
 Whenever one object exerts a force on another object, the second exerts an equal and opposite force on the first.

OR

For every action there is an equal and opposite reaction.

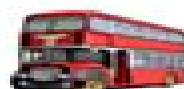

Inertia

Inertia is the property of an object that resists change of motion.

Moving objects have inertia: they want to keep moving;
 stopped objects have inertia: they want to stay at rest.

More mass = more inertia!

Something that is harder to push has more inertia!

More mass, more inertia

Less mass, less inertia

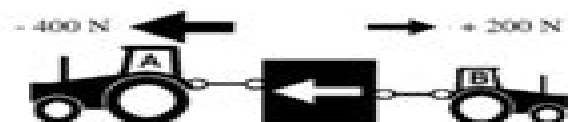

Force

A **force** is any action that can change or cause motion.
A force is any push or pull.
 We use Newtons (N) to measure force.

Net Force

Net force is the sum of all the forces and has direction. (Be sure to make right positive and left negative.)

An object will move in the direction of the net (or unbalanced) force.

Net Force = + 200 N - 400 N = - 200 N (left)

Newton's Second Law

Force
(in Newtons)

$$F = ma$$

Mass
(in kg)

Acceleration
(in m/sec²)

Force equals mass times acceleration.

$F = ma$ tells us:

For the same acceleration,
more mass

requires more force.

For the same mass,
more acceleration
requires more force.

Newton's 2nd Law tells us that when you accelerate (stomp on the gas) or decelerate quickly (brake fast) you use more force and wear out engine parts and brakes faster.

Ex. How big a force does it take to give a 50 kg object an acceleration of 40 m/s².

Variables:

$$40 \text{ m/s}^2 = a$$

$$50 \text{ kg} = m$$

$$F = ?$$

Solve:

$$F = ma$$

$$F = 50(40)$$

$$F = 50 \times 40$$

$$F = 2000\text{N}$$

Equation:

$$F = ma$$

Ex. If a 50 N force pulls on a 10 kg object, how much acceleration will occur?

Variables:

$$50 \text{ N} = F$$

$$10 \text{ kg} = m$$

$$a = ?$$

Solve:

$$F = ma$$

$$50 = 10a$$

$$\frac{50}{10} = \frac{10a}{10}$$

$$a = 5 \text{ m/s}^2$$

Equation:

$$F = ma$$

Ex. A force of 49 N causes a 7 m/s² acceleration. Find the mass of the object it was pulling.

Variables:

$$49 \text{ N} = F$$

$$7 \text{ m/s}^2 = a$$

$$m = ?$$

Solve:

$$F = ma$$

$$49 = m7$$

$$\frac{49}{7} = \frac{m7}{7}$$

$$m = 7 \text{ kg}$$

Equation:

$$F = ma$$

By ... T. Newton, Etc Sir Isaac Newton,1805 **Newton's Principia** Isaac Newton,2016-09-26 Mathematical Principles of Natural Philosophy often referred to as simply the Principia is a work in three books by Isaac Newton in Latin first published 5 July 1687 The Principia states Newton s laws of motion forming the foundation of classical mechanics Newton s law of universal gravitation and a derivation of Kepler s laws of planetary motion which Kepler first obtained empirically The Principia is justly regarded as one of the most important works in the history of science Alexis Clairaut assessed it in 1747 The famous book of mathematical Principles of natural Philosophy marked the epoch of a great revolution in physics The method followed by its illustrious author Sir Newton spread the light of mathematics on a science which up to then had remained in the darkness of conjectures and hypotheses A more recent assessment has been that while acceptance of Newton s theories was not immediate by the end of a century after publication no one could deny that out of the Principia a science had emerged that at least in certain respects so far exceeded anything that had ever gone before that it stood alone as the ultimate exemplar of

science generally *A Student's Guide to Newton's Laws of Motion* Sanjoy Mahajan, 2020-03-31 Newton's laws of motion which introduce force and describe how it affects motion are the gateway to physics yet they are often misunderstood due to their many subtleties. Based on the author's twenty years of teaching physics and engineering, this intuitive guide to Newton's laws of motion corrects the many misconceptions surrounding this fundamental topic. Adopting an informal and pedagogical approach and a clear accessible style, this concise text presents Newton's laws in a coherent story of force and motion. Carefully scaffolded everyday examples and full explanations of concepts and equations ensure that all students studying physics develop a deep understanding of Newton's laws of motion.

Newton's Principia Isaac Newton, 2020-06-05 It was Isaac Newton's *Principia* that founded the law of universal gravitation on 5th July 1687. It is the same *Principia* that inspired Albert Einstein into formulating the Einstein field equations, the general relativity theory. It is still the same *Principia*. I believe will lead us to the quantum theory of gravity. Quantum gravity. According to Newton's *Principia*, the force of gravity governs the movement of bodies in the solar system. It is this simple mathematical law which determines the motion of bodies. The force of gravity accurately predicts the planetary orbits; it was used to put the first man on the moon; it predicts the return of comets; the rotation of galaxies; the solar eclipses; artificial satellites; satellite communications and television; the GPS and interplanetary probes. I almost forgot it is why NASA was established in the first place. The book has an active table of contents for readers to access each chapter.
