

100

Abstract—The purpose of this study was to determine the effect of a 12-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 sedentary women, 30 to 45 years of age, who were randomly selected from a telephone directory. The subjects were divided into two groups: a control group and a training group. The control group consisted of six women who did not participate in any physical activity during the study. The training group consisted of six women who participated in a 12-week training program. The training program consisted of three sessions per week, each lasting 30 minutes. The sessions were performed on a stationary bike at a heart rate of 150 beats per minute. The HR and EE were measured at the beginning and end of the study. The HR and EE of the training group increased significantly after 12 weeks of training, while the HR and EE of the control group remained unchanged. The results of this study suggest that a 12-week training program can improve the HR and EE of sedentary, middle-aged women.

1. The first step in the process of identifying a problem is to define the problem. This involves identifying the symptoms and the underlying causes of the problem. Once the problem has been defined, the next step is to gather information about the problem. This can be done through a variety of methods, including interviews, surveys, and observation. Once the information has been gathered, the next step is to analyze the information. This involves identifying the key factors that are contributing to the problem and determining the best way to address the problem. Finally, the last step in the process is to implement a solution. This involves putting the solution into action and monitoring the results to ensure that the problem has been resolved.

100

Abstract—The purpose of this study was to determine the effect of a 10-week training program on the heart rate (HR) and energy expenditure (EE) of sedentary, middle-aged women. The subjects were 12 women, 40 to 50 years of age, who were sedentary and had no cardiovascular or respiratory disease. They were randomly assigned to a 10-week training program or a control group. The training program consisted of three sessions per week of 30 minutes of aerobic exercise at 60% of the maximum HR. The control group did not exercise. The HR and EE were measured at rest and during exercise at the beginning and end of the 10-week period. The results showed that the training program had a significant effect on the HR and EE of the subjects. The HR at rest decreased significantly from 72 to 68 beats per minute (p < 0.05). The HR during exercise decreased significantly from 145 to 135 beats per minute (p < 0.05). The EE at rest decreased significantly from 1,200 to 1,100 kcal per day (p < 0.05). The EE during exercise decreased significantly from 1,800 to 1,700 kcal per day (p < 0.05). The results suggest that a 10-week training program can improve the cardiovascular and metabolic health of sedentary, middle-aged women.

[illegible]

Figure 1 consists of two line graphs, (a) and (b), showing the percentage of respondents for different levels of agreement with the statement "The government should do more to help people who are struggling financially".

Graph (a) shows the percentage of respondents for different levels of agreement (Strongly agree, Agree, Disagree, Strongly disagree) across four categories: Total, White, Black, and Hispanic. The Y-axis represents the percentage (0 to 100). The X-axis represents the level of agreement. The legend indicates: Strongly agree (black square), Agree (white square), Disagree (grey square), and Strongly disagree (dark grey square).

Level of Agreement	Total	White	Black	Hispanic
Strongly agree	~65%	~60%	~75%	~70%
Agree	~30%	~35%	~20%	~25%
Disagree	~5%	~5%	~5%	~5%
Strongly disagree	~0%	~0%	~0%	~0%

Graph (b) shows the percentage of respondents for different levels of agreement (Strongly agree, Agree, Disagree, Strongly disagree) across four categories: Total, White, Black, and Hispanic. The Y-axis represents the percentage (0 to 100). The X-axis represents the level of agreement. The legend indicates: Strongly agree (black square), Agree (white square), Disagree (grey square), and Strongly disagree (dark grey square).

Level of Agreement	Total	White	Black	Hispanic
Strongly agree	~60%	~55%	~70%	~65%
Agree	~35%	~40%	~25%	~30%
Disagree	~5%	~5%	~5%	~5%
Strongly disagree	~0%	~0%	~0%	~0%

Figure 1 Schematic representation of the experimental design. The first part of the experiment consisted of a 10-min familiarization period. The second part consisted of 10 trials, each with a 10-min familiarization period, a 10-min test period, and a 10-min rest period. The third part consisted of 10 trials, each with a 10-min familiarization period, a 10-min test period, and a 10-min rest period. The fourth part consisted of 10 trials, each with a 10-min familiarization period, a 10-min test period, and a 10-min rest period.

SAFARI

SAFARI is a line of vehicles designed for rugged, off-road use. It includes a variety of models, from compact cars to large trucks, all built for durability and performance in challenging environments. The vehicles are equipped with features like heavy-duty suspension, large tires, and robust engines to handle tough terrain. SAFARI vehicles are widely used in industries like construction, mining, and logistics, where reliability and the ability to operate in remote areas are crucial.

QUESTION A 60-year-old male with a 10-year history of type 2 diabetes mellitus presents with a 2-week history of increasing fatigue, weight loss, and decreased appetite. He reports frequent urination and increased thirst. His medical history is significant for hypertension, hyperlipidemia, and chronic kidney disease (CKD). He is currently taking metformin, lisinopril, and atorvastatin. His last hemoglobin A1c was 8.5%. Physical examination reveals mild dehydration, tachycardia, and normal bowel sounds. Laboratory studies show a serum glucose of 250 mg/dL, serum bicarbonate of 18 mEq/L, and a negative urine ketone test. What is the most likely diagnosis?

ANSWER A. Type 1 diabetes mellitus
B. Type 2 diabetes mellitus
C. Gestational diabetes mellitus
D. Diabetes insipidus

EXPLANATION The patient's symptoms and laboratory findings are consistent with type 2 diabetes mellitus. The presence of hyperglycemia (serum glucose 250 mg/dL) and metabolic acidosis (serum bicarbonate 18 mEq/L) suggests a diabetic emergency, such as diabetic ketoacidosis (DKA) or hyperosmolar hyperglycemic state (HHS). However, the negative urine ketone test argues against DKA. The patient's long-standing history of type 2 diabetes, along with his current medications (metformin, lisinopril, atorvastatin), further supports the diagnosis of type 2 diabetes mellitus. The symptoms of fatigue, weight loss, and decreased appetite are common in poorly controlled diabetes. The physical examination findings of mild dehydration and tachycardia are also consistent with hyperglycemia. The patient's last hemoglobin A1c of 8.5% indicates poor glycemic control. Therefore, the most likely diagnosis is type 2 diabetes mellitus.
