Therapies in Glioblastoma Konstantinos Gousias, Theophilos Tzaridis, Marika Broekman, 2025-06-17 Despite recent advances in diagnostic modalities and surgical techniques the prognosis of patients with glioblastoma remains still dramatically poor. Even after successful resections the 1 year survival rates lie below 50% since the traditional systemic adjuvant therapy after surgery appears inefficient. Poor prognosis has been associated with the unique challenges presented by the blood brain barrier (BBB) which hinders the concentration of chemotherapeutic agents able to reach tumors and mitigates the effects of systemic delivery. Therefore there is a need for alternative treatment approaches which overcome the BBB and have a lesser toxicity profile. Several novel therapeutic strategies are currently being explored in early phase clinical trials for the treatment of glioblastoma including selective intra arterial or intra nasal approaches in addition to direct low and high pressure drug delivery in the tumor cavity or eloquent solid tumor. Further targeted therapies leveraging nanoparticles and autologous vaccines appear as promising alternatives. Other options focus on temporarily modifying the BBB such as using focused ultrasound or directly destroying tumor cells such as with photodynamic or thermal therapy.
