

Through rapids are cut out of canyons by river flows, where the gentler slope material is washed away, leaving the rough place.

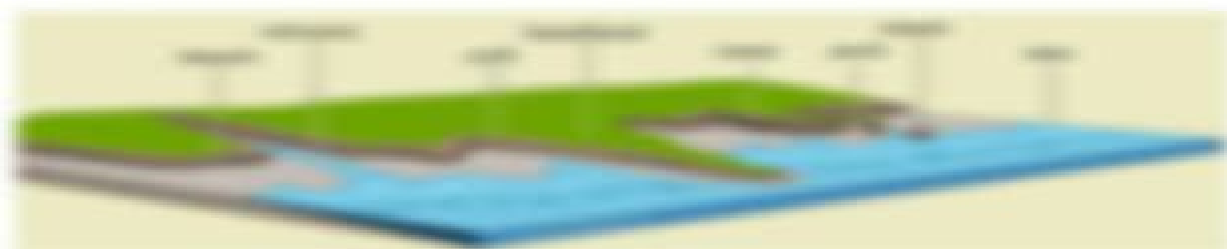

Steady rapids are an indication of fast river flows washing away leaving the material made and dragged where they meet. With time, the soft heap up and structure is pushed upstream, eroding into the river.

Low stream can flow in cut their way into a hard rock and stone mountain (sand, silt, and rock) after they become easy.

## **Coastlines**

A coastline is just the position the land and the oceans or seas. It incorporates all the sea shores, peninsulas, capes, bays, gulfs, fjords and estuaries that flow up toward the fronts of the land. These highlights may all be found near one another or a coastline.

Coastlines change with time. At the point when ocean levels rise and fall, coastlines are different. Steady erosion or motion develops coastline changes the shape and type of coastline. These highlights, for example, straits and bays are shaped and more common highlights become separate.

The coastline of the world's largest measure around 175,000 km (110,000 miles).

Coastlines are formed from multiple points of view. The shore of a large peninsula by sea flows and waterways entering the water, and furthermore by erosion by waves. Rough and rough coastlines are normally formed by erosion while steady sea shores, peninsulas, and straits coastlines are generally those shaped from sedimentary shores. Earth or structural developments can become built up new peninsulas or gulf and sea changes from shore by mountains, making new sediment features.

## **Continental Shelf**

This is the place of the continent that extends out into the ocean with no huge ridges and with shallow waters near it.

The significant terms are typically utilized in portraying the continental shelf. The shelf break and the continental slope.
