

The Grand Canyon

One of the most powerful forces in nature is a moving river. Rivers are an erosive force that can wear down tall mountains and carry away the sediments with ease, eliminating the evidence of a once-tall mountain. The **Grand Canyon**—with the help of the **Colorado River** plus erosion, volcanoes, and a hot and dry climate—was formed over millions of years in the state of Arizona.

The Grand Canyon is 277 miles long and the width in some areas reaches up to 18 miles. In all, the Grand Canyon's area is approximately 1,904 square miles. Its depth averages about one mile or 5,280 feet, but in some places, it is much deeper. The Grand Canyon is so large, it can be seen from space.

The Grand Canyon is in the northwest corner of Arizona and is close to the borders of Utah and Nevada. Most of the canyon lies within Grand Canyon National Park and is managed by the National Park Service (NPS), the Native American Tribes—Hualapai Tribal Nation, and the Havasupai Tribe.

Water was mainly responsible for this massive canyon and most of the erosion that carved a valley into the earth's surface. The Colorado River has flowed through the canyon for many years, but when it rains in the area, the baked dry dirt cannot hold the moisture. The rainwater then begins to run down towards the river and flash flooding occurs.

The flood water moves so fast that it knocks over boulders and easily carries rocks in its path. As the dirt is swept along only hard rock formations are left behind. Then, during the severe winters, water seeps into the crevices of the hard rock, it freezes, the cracks get bigger, and the rocks further crack and break apart. Water then continues to move these rocks and sediment along its path.
