

Research Statement

My research deals with designing and analyzing large systems that constantly need to meet scaling demands. Current large scale systems face a huge increase in information generated by consuming customers. Scaling such systems under different constraints can prove difficult. On one hand, using powerful dedicated machines can be expensive. On the other hand, many researchers consider that using standard off the shelf hardware (while achieving lower prices) can increase system complexity and sometimes requires a change in paradigms. Protocols and principles that have brought order to the Internet world now show some of their weaknesses and re-engineering is required to improve or maintain performance in the new settings. One can only note that some of the most important techniques that have emerged break the layering paradigm by making decisions based on information available in other layers.

Although there have been a number of significant results related to the social behavior of users when using Internet applications and services no significant research effort can be seen on applying these results on the actual design of systems. For now, one can only conjecture the benefits of using social information in different aspects of system functionality. My work aims at addressing this: using social information such as application usage patterns, communication patterns in the design and implementation of systems with the ultimate goal of scalability. In a broader context my work might help the emergence of new, social paradigms that could improve the design and functionality of systems.

The following sections outline my past and future research directions.

1. Past research directions

In order to scale existing systems one needs to understand how, where and when people are using such them. Trying to understand this, I became fascinated with the question: "What do people do on the Internet?". The usual steps I had to take to answer this question were clear: obtain traffic traces from operational networks and try to determine the applications that people access. With regards to this, some of the work I did comes from an effort to think 'outside the box' and find alternative cheaper approaches for solving networking and systems problems.

Traffic classification and application usage: In collaboration with researchers from Narus Inc(now part of Boeing). I have developed techniques for easily determining application usage across different world regions and across different network address ranges by using queries to search engines. The techniques I
