Insuffisance Circulatoire Aigueuml:

Insuffisance circulatoire aiguë Christian Richard, Jean-Louis Teboul, SRLF (Société de Réanimation de Langue Française), Jean-Louis Vincent, 2011-06-17 L insuffisance circulatoire aiguë est un des motifs les plus fréquents d'admission dans les unités de réanimation. Elle exige de la part du réanimateur une connaissance approfondie de la physiopathologie du diagnostic et du traitement de cette détresse vitale. Pour aider le médecin dans cette démarche de nombreux outils de monitoring cardiovasculaire sont disponibles au lit du malade. C'est en maîtrisant parfaitement l'utilisation et les indications de ces différentes techniques d'investigation que le réanimateur sera le garant de la qualité et de la sécurité des soins que chaque patient est en droit d'exiger. Le lecteur trouvera dans cet ouvrage la réponse à la question de la prise en charge de la grande majorité des situations conduisant à la survenue d'une insuffisance circulatoire aiguë. Ces situations ne relèvent pas en effet d'une prise en charge univoque mais d'une stratégie diagnostique et thérapeutique spécifique de la cause identifiée. Cet ouvrage fruit du travail de quelques uns des meilleurs experts sur le thème de l'insuffisance circulatoire aiguë tant en France qu'à l'étranger exprime l'état des connaissances en 2009. Sa lecture attentive montre combien demeurent d'incertitudes tant sur le choix de l'outil de monitoring cardiovasculaire idéal que de la meilleure stratégie thérapeutique. C'est donc sans parti pris dogmatique qu'il a été rédigé. Chacun pourra ainsi dans son environnement professionnel décider de la stratégie qui dispose du meilleur rapport risque/bénéfice. D'ordinaire moins invasive l'exploration cardiovasculaire n'en demeure pas moins un simple outil au service d'une prise en charge réfléchie. Se contenter en effet d'une approche ne visant qu'à normaliser de manière isolée une valeur de pression artérielle de débit cardiaque de saturation du sang veineux mixte en oxygène ou de tout autre paramètre hémodynamique ne peut conduire qu'à de fausses illusions. Il faut certainement substituer cette approche simpliste à une prise en compte globale du patient et de son passé afin de proposer une prise en charge plus personnalisée.

Insuffisance circulatoire aiguë Christian Richard, Jean-Louis Vincent, 1994 Quelle qu'en soit la cause l'insuffisance circulatoire aiguë constitue une situation clinique fréquemment rencontrée dans les unités de réanimation. Pour y faire face le réanimateur se doit de maîtriser tant les données physiopathologiques et les méthodes diagnostiques que les moyens thérapeutiques disponibles. Il sera ainsi amené à finir une stratégie de prise en charge dans des situations aussi diverses que le choc septique l'insuffisance cardiaque aiguë l'intoxication aiguë ou le polytraumatisme pour n'en citer que quelques unes. Souvent devant un patient présentant une insuffisance circulatoire aiguë le réanimateur est amené à se demander faut-il mesurer la pression artérielle pulmonaire d'occlusion. Qu'en est-il de la mesure en continu de la saturation du sang veineux mixte en oxygène. Le lactate plasmatique est-il un bon marqueur pronostique. Faut-il corriger l'acidose métabolique fréquemment associée. Quel médicament vasoactif choisir et sur quel critère. À ces questions et à l'évidence beaucoup d'autres cet ouvrage tente de répondre dans un souci de rigueur physiopathologique associé au pragmatisme d'auteurs choisis pour leur large expérience clinique au sein des unités de réanimation. L'ensemble est convaincant enrichi d'illustrations qui en facilitent la lecture et complété par une abondante

bibliographie qui incitera le lecteur motivé à approfondir ses connaissances Insuffisance circulatoire aiguë Elisabeth Balagny, 1989 **ETUDE DES EFFETS HEMODYNAMIQUES DE L'EXPANSION VOLEMIQUE DANS L'INSUFFISANCE CIRCULATOIRE AIGUE SECONDAIRE A UNE EMBOLIE PULMONAIRE MASSIVE** ALEXANDRA.. TELFOUR, 1994 **Fonction vasculaire dans les insuffisances circulatoires aiguës** Pierre-Grégoire Guinot, 2017 En anesthésie et réanimation l'insuffisance circulatoire aiguë vasoplogique est une situation quotidiennement rencontrée dans le sepsis et la chirurgie polytraumatisme qui implique une prise en charge rapide par l'utilisation d'un agent vasopresseur noradrénaline le plus souvent. Ce syndrome fait partie d'une atteinte plus large de la fonction vasculaire qui comprend une dysfonction de l'endothélium vasculaire et de ses fonctions de modulation du tonus vasculaire de la perméabilité vasculaire de la cascade de la coagulation et des cellules immunitaires. Dans la première étude nous avons démontré que la survenue d'un syndrome vasoplogique est associée à un trouble de la vasomotricité endothéliale dépendant de la voie du monoxyde d'azote NO. Dans le deuxième travail nous avons évalué le couplage ventriculo-artériel chez des patients avec une insuffisance circulatoire dite vasoplogique. L'analyse hémodynamique par une approche du couplage ventriculo-artériel couplage VA caractérise mieux l'état hémodynamique qu'une approche conventionnelle de résistances. L'indice de couplage ventriculo-artériel prédit l'évolution de la pression artérielle et du débit cardiaque avec un traitement par noradrénaline contrairement aux variables hémodynamiques habituelles. Dans la troisième étude nous avons décrit un nouvel indice hémodynamique permettant d'évaluer en temps réel le tonus vasomoteur et la résistance artérielle dynamique, donc du besoin en noradrénaline. L'indice de résistance artérielle dynamique prédit la dépendance de la pression artérielle à la noradrénaline. Dans le dernier travail nous avons validé l'utilisation de cet indice au lit du malade pour optimiser le traitement par noradrénaline. Ces études soulignent l'impact clinique positif d'une nouvelle approche du syndrome vasoplogique en repositionnant notre regard de l'hémodynamique selon une approche dynamique de la résistance artérielle dynamique et du couplage ventriculo-artériel. Prédire de manière fiable la réponse au remplissage est essentiel dans la prise en charge de l'insuffisance circulatoire aiguë. Notre étude évalue la fiabilité de la variation de la VPP (variation de la pression pulsée) pendant un lever de jambes passif pour prédire cette réponse. Nous avons réalisé une étude observationnelle prospective et multicentrique de patients présentant une insuffisance circulatoire aiguë et recevant un remplissage vasculaire après la réalisation d'un lever de jambes passif. La variation de VPP pendant le lever de jambes passif était comparée avec la variation du volume d'éjection systolique pour déterminer sa fiabilité pour prédire la réponse au remplissage, définie comme une augmentation de 15% du volume d'éjection systolique après remplissage. Nous avons inclus et analysé 146 patients : 114 répondant au remplissage et 32
