Fractals of Brain, Fractals of Mind Earl R. Mac Cormac, Maksim Stamenov, 1996 This collective volume is the first to discuss systematically what are the possibilities to model different aspects of brain and mind functioning with the formal means of fractal geometry and deterministic chaos At stake here is not an approximation to the way of actual performance but the possibility of brain and mind to implement nonlinear dynamic patterns in their functioning The contributions discuss the following topics among others the edge of chaos dynamics in recursively organized neural systems and in intersensory interaction the fractal timing of the neural functioning on different scales of brain networking aspects of fractal neurodynamics and quantum chaos in novel biophysics the fractal maximum power evolution of brain and mind the chaotic dynamics in the development of consciousness etc It is suggested that the margins of our capacity for phenomenal experience are fractal limit phenomena Here the possibilities to prove the plausibility of fractal modeling with appropriate experimentation and rational reconstruction are also discussed A conjecture is made that the brain vs mind differentiation becomes possible most probably only with the imposition of appropriate symmetry groups implementing a flowing interface of features of local vs global brain dynamics Series B

Meteorites and the Early Solar System II Dante S. Lauretta, Harry Y. McSween, 2006-07 They range in size from microscopic particles to masses of many tons The geologic diversity of asteroids and other rocky bodies of the solar system are displayed in the enormous variety of textures and mineralogies observed in meteorites The composition chemistry and mineralogy of primitive meteorites collectively provide evidence for a wide variety of chemical and physical processes This book synthesizes our current understanding of the early solar system summarizing information about processes that occurred before its formation It will be valuable as a textbook for graduate education in planetary science and as a reference for meteoriticists and researchers in allied fields worldwide

Invariant Recognition of Visual Objects Evgeniy Bart, Jay Hegdé, This Research Topic will focus on how the visual system recognizes objects regardless of variations in the viewpoint illumination retinal size background etc Contributors are encouraged to submit articles describing novel results models viewpoints perspectives and or methodological innovations relevant to this topic The

issues we wish to cover include but are not limited to perceptual invariance under one or more of the following types of image variation Object shape Task Viewpoint from the translation and rotation of the object relative to the viewer Illumination shading and shadows Degree of occlusion Retinal size Color Surface texture Visual context including background clutter and crowding Object motion including biological motion Examples of questions that are particularly interesting in this context include but are not limited to Empirical characterizations of properties of invariance does invariance always exist How wide is its range and how strong is the tolerance to viewing conditions within this range Invariance in naive vs experienced subjects Is invariance built in or learned How can it be learned under which conditions and how effectively Is it learned incidentally or are specific task and reward structures necessary for learning How is generalizability and transfer of learning related to the generalizability invariance of perception Invariance during inference Are there conditions e g fast presentation time or otherwise resource constrained recognition when invariance breaks What are some plausible computational or neural mechanisms by which invariance could be achieved

Vision and Mind Vadim D. Glezer, 2013-05-13 The usual method for studying mental processes entails taking words in linguistics or concepts in logic and establishing the connections and relationships between them Thus the traditional approach to semantic problems those of meaning and understanding is through language Most researchers agree that thought and language are generated by deep seated semantic structures determined by the structure of the brain Until now however all attempts at constructing semantic models have been made on the basis of linguistic material alone without taking brain structure into account Analysis of these models shows them to be as inadequate as those based on the method of the black box This book approaches the problem of the organization of higher psychological functions a different way by analyzing the functional organization of the neural structures that gradually form universal categories from raw sensory material At the higher levels of the brain's operation these universals correspond to the basic categories of thought and language The visual system provides rewarding material for such an approach both because it is relatively well researched and because it is the main source of sensory information in humans With this in mind this monograph examines the whole process of the transformation and description the coding of visual information The most important aspect of this process is the transition from the description of visual space to the description of individual objects and the relationships between them This transition is made possible by the existence in the visual system of various mechanisms that developed during evolution as a result of environmental influences Written for a wide circle of investigators in disciplines associated with different aspects of the functioning of the brain physiologists and psychologists this book is also of importance to engineers and mathematicians working on the problems of artificial intelligence and linguists and philosophers interested in the deep structures that form the universals of thought and language
