

## ARMS AND LEGS

Identify established form and measure of the rib cage and pelvis, the head and shoulders defining the arms and legs to their placement and perspective.

One of the main goals when working through a construction-based study of a figure is to keep all the forms balanced in design and in volume.

Remember, developing a construction drawing is not necessarily the desired finished product. Rather, this is one invaluable stage of knowledge (gaining more often) that has to be integrated into any image.

- On the arm, represents the head of the humerus, and on the leg, the top of the great trochanter of the femur.
- Represents the elbow (end of the humerus) and the radius and ulna.
- Represents the knee and ankle.

When developing the arm, one of the most difficult steps is ensuring the correct perspective. The four related drawings on the left show the process for developing the arm in a cylinder.

The first step is to use the line to show the direction and length of the arm.

In the second step, draw only three parallel lines to determine the width of the cylinder.

The third step is to give the cylinder a perspective based on the type of ellipse chosen.

The cylinder with the orange dot above it is an example of using the ellipse to show the view from above the object.

The cylinder with the green dot above it shows the view from underneath. When choosing an ellipse for the cylinder, alter the minor axis without affecting the width.

The illustration demonstrates how to turn a cylinder in space by changing the size of the ellipse. The fourth step (in the bottom right corner) completes the cylinder by putting a cap on the open end. This cap should be an exact copy of the arc of the ellipse from the other side.
