

1.1 A 2-kHz sound wave traveling in the x -direction in air was observed to have a differential pressure $p(x, t) = 10 \text{ N/m}^2$ at $x = 0$ and $t = 50 \mu\text{s}$. If the reference phase of $p(x, t)$ is 36° , find a complete expression for $p(x, t)$. The velocity of sound in air is 330 m/s .

Solution: The general form is given by Eq. (1.17),

$$p(x, t) = A \cos \left(\frac{2\pi t}{T} - \frac{2\pi x}{\lambda} + \phi_0 \right),$$

where it is given that $\phi_0 = 36^\circ$. From Eq. (1.26), $T = 1/f = 1/(2 \times 10^3) = 0.5 \text{ ms}$. From Eq. (1.27),

$$\lambda = \frac{v_p}{f} = \frac{330}{2 \times 10^3} = 0.165 \text{ m}.$$

Also, since

$$\begin{aligned} p(x = 0, t = 50 \mu\text{s}) &= 10 \text{ (N/m}^2\text{)} = A \cos \left(\frac{2\pi \times 50 \times 10^{-6}}{5 \times 10^{-4}} + 36^\circ \frac{\pi \text{ rad}}{180^\circ} \right) \\ &= A \cos(1.26 \text{ rad}) = 0.31A, \end{aligned}$$

it follows that $A = 10/0.31 = 32.36 \text{ N/m}^2$. So, with t in (s) and x in (m),

$$\begin{aligned} p(x, t) &= 32.36 \cos \left(2\pi \times 10^3 \frac{t}{500} - 2\pi \times 10^3 \frac{x}{165} + 36^\circ \right) \quad (\text{N/m}^2) \\ &= 32.36 \cos(4\pi \times 10^3 t - 12.12\pi x + 36^\circ) \quad (\text{N/m}^2). \end{aligned}$$

Optical diffraction tomography as a case of study** Gloria Ortega López, 2015-04-14 This thesis entitled High Performance Computing for solving large sparse systems Optical Diffraction Tomography as a case of study investigates the computational issues related to the resolution of linear systems of equations which come from the discretization of physical models described by means of Partial Differential Equations PDEs These physical models are conceived for the description of the space temporary behavior of some physical phenomena $f(x, y, z, t)$ in terms of their variations partial derivative with respect to the dependent variables of the phenomena There is a wide variety of discretization methods for PDEs Two of the most well known methods are the Finite Difference Method FDM and the Finite Element Method FEM Both methods result in an algebraic description of the model that can be translated into the approach of a linear system of equations of type $Ax = b$ where A is a sparse matrix a high percentage of zero elements whose size depends on the required accuracy of the modeled phenomena This thesis begins with the algebraic description of the model associated with the physical phenomena and the work herein has been focused on the design of techniques and computational models that allow the resolution of these linear systems of equations The main

interest of this study is specially focused on models which require a high level of discretization and usually generate sparse matrices A which have a highly sparse structure and large size Literature characterizes these types of problems by their high demanding computational requirements because of their fine degree of discretization and the sparsity of the matrices involved suggesting that these kinds of problems can only be solved using High Performance Computing techniques and architectures One of the main goals of this thesis is the research of the possible alternatives which allow the implementation of routines to solve large and sparse linear systems of equations using High Performance Computing HPC The use of massively parallel platforms GPUs allows the acceleration of these routines because they have several advantages for vectorial computation schemes On the other hand the use of distributed memory platforms allows the resolution of problems defined by matrices of enormous size Finally the combination of both techniques distributed computation and multi GPUs will allow faster resolution of interesting problems in which large and sparse matrices are involved In this line one of the goals of this thesis is to supply the scientific community with implementations based on multi GPU clusters to solve sparse linear systems of equations which are the key in many scientific computations The second part of this thesis is focused on a real physical problem of Optical Diffractive Tomography ODT based on holographic information ODT is a non damaging technique which allows the extraction of the shapes of objects with high accuracy Therefore this technique is very suitable to the in vivo study of real specimens microorganisms etc and it also makes the investigation of their dynamics possible A preliminary physical model based on a bidimensional reconstruction of the seeding particle distribution in fluids was proposed by J Lobera and J M Coupland However its high computational cost in both memory requirements and runtime made compulsory the use of HPC techniques to extend the implementation to a three dimensional model In the second part of this thesis the implementation and validation of this physical model for the case of three dimensional reconstructions is carried out In such implementation the resolution of large and sparse linear systems of equations is required Thus some of the algebraic routines developed in the first part of the thesis have been used to implement computational strategies capable of solving the problem of 3D reconstruction based on ODT
