Painlevé III: A Case Study in the Geometry of Meromorphic Connections Martin A. Guest, Claus Hertling, 2017-10-14 The purpose of this monograph is two fold it introduces a conceptual language for the geometrical objects underlying Painlevé equations and it offers new results on a particular Painlevé III equation of type $PIII_{D6}$ called $PIII_{0\ 0\ 4\ 4}$ describing its relation to isomonodromic families of vector bundles on P^1 with meromorphic connections This equation is equivalent to the radial sine or sinh Gordon equation and as such it appears widely in geometry and physics It is used here as a very concrete and classical illustration of the modern theory of vector bundles with meromorphic connections Complex multi valued solutions on \mathbb{C} are the natural context for most of the

monograph but in the last four chapters real solutions on R^0 with or without singularities are addressed These provide examples of variations of TERP structures which are related to tt geometry and harmonic bundles As an application a new global picture is given

Generalized Ricci Flow Mario Garcia-Fernandez, Jeffrey Streets, 2021-04-06 The generalized Ricci flow is a geometric evolution equation which has recently emerged from investigations into mathematical physics Hitchin's generalized geometry program and complex geometry This book gives an introduction to this new area discusses recent developments and formulates open questions and conjectures for future study The text begins with an introduction to fundamental aspects of generalized Riemannian complex and Kähler geometry This leads to an extension of the classical Einstein Hilbert action which yields natural extensions of Einstein and Calabi Yau structures as canonical metrics in generalized Riemannian and complex geometry The book then introduces generalized Ricci flow as a tool for constructing such metrics and proves extensions of the fundamental Hamilton Perelman regularity theory of Ricci flow These results are refined in the setting of generalized complex geometry where the generalized Ricci flow is shown to preserve various integrability conditions taking the form of pluriclosed flow and

generalized Kähler Ricci flow leading to global convergence results and applications to complex geometry Finally the book gives a purely mathematical introduction to the physical idea of T duality and discusses its relationship to generalized Ricci flow The book is suitable for graduate students and researchers with a background in Riemannian and complex geometry who are interested in the theory of geometric evolution equations *Cortex: Statistics and Geometry of Neuronal*

Connectivity Valentino Braitenberg, Almut Schüz, 2013-03-14 By means of quantitative analysis of the tissue components in the cortex of the mouse this book presents an overall picture of the cortical network which is then related to various theories on cortical function Centering around the idea of a diffuse network in a fairly homogeneous population of excitatory neurons that of the pyramidal cells it shows that the whole organisation in the cortical skeleton of pyramidal cells corresponds well with the idea of an associative memory and with the theory of cell assemblies Provides the reader with information on quantitative neuroanatomy and also on the methods used in particular those that vary from the norm **Cartan for**

Beginners Thomas A. Ivey, Joseph M. Landsberg, 2016-12-15 Two central aspects of Cartan's approach to differential geometry are the theory of exterior differential systems EDS and the method of moving frames This book presents thorough and modern treatments of both subjects including their applications to both classic and contemporary problems in geometry It begins with the classical differential geometry of surfaces and basic Riemannian geometry in the language of moving frames along with an elementary introduction to exterior differential systems Key concepts are developed incrementally with motivating examples leading to definitions theorems and proofs Once the basics of the methods are established the authors develop applications and advanced topics One notable application is to complex algebraic geometry where they expand and update important results from projective differential geometry As well the book features an introduction to G structures and a treatment of the theory of connections The techniques of EDS are also applied to obtain explicit solutions of PDEs via Darboux's method the method of characteristics and Cartan's method of equivalence This text is suitable for a one year graduate course in differential geometry and parts of it can be used for a one semester course It has numerous exercises and examples throughout It will also be useful to experts in areas such as geometry of PDE systems and complex algebraic geometry who want to learn how moving frames and exterior differential systems apply to their fields The second edition features three new chapters on Riemannian geometry emphasizing the use of representation theory on the latest developments in the study of Darboux integrable systems and on conformal geometry written in a manner to introduce readers to the related parabolic geometry perspective Technology in Mathematics Education: Contemporary Issues
