Mascarenhas, 2011 Human settlements have grown near watercourses since ancient times Water supply irrigation navigation wastewater conveyance and city defense are some of the uses that were responsible for this choice Even floods played an important role favoring the soil fertilization Man made actions however especially in urban watersheds significantly modify the natural water cycle increasing the magnitude of floods and their potential damages Consequently flood damages are one of the most important issues to be dealt with in the present days Several different studies show that floods are one of the most important natural hazards with several losses both in terms of lives and money Particularly in urban areas the amplification of floods may cause important economic losses and lead to critical social risks to the cities and their population

when inundation reaches the built environment This situation is becoming more frequent each day Recent history shows that urbanization is an inevitable trend and today the most part of the world population lives in cities It is difficult however to adequately manage urban flood problems because flood risk and flood costs are not easy to quantify Traditionally flood risk and flood cost assessments face difficulties due to the subjective nature of these evaluations and to the inexistence of standardized methodologies This book tries to show different techniques and approaches to help in treating flood problems Chapters 1 and 2 show simplified mathematical modeling of floods and results of multifunctional landscape flood control measures in the city of Rio de Janeiro The remaining book chapters present remedial works against debris after floods in Venezuela and Measures for Mitigation of Flood areas in Japan There are also presented studies related with Flood Risk Assessment and Management in Mediterranean Basins The final chapter shows an interesting study related to the attitudes of residents in the Tokyo Bay area toward flood hazards
