

to maintain a comfortable environment inside the house. By analyzing the heat transfer and air flow, we learn what heat transfer (and air flow) is required for the house to be a comfortable place. A thermodynamic analysis will tell us the conditions needed to maintain the temperature and relative humidity, and that analysis will tell us the size of the fan required to push the air in, the fan power, and the duct needed to distribute the cooled air throughout the house.

Perhaps we want to focus on the air conditioning itself. Figure 1.2 is a schematic of two heat exchangers, a compressor, and a valve. A thermodynamic analysis would tell us how much refrigerant, what size a second source of cooling, a heat transfer analysis would tell us the heat transfer, the fluid dynamics analysis would tell us the pressure drop, the compressor power, as well as the required compressor size.

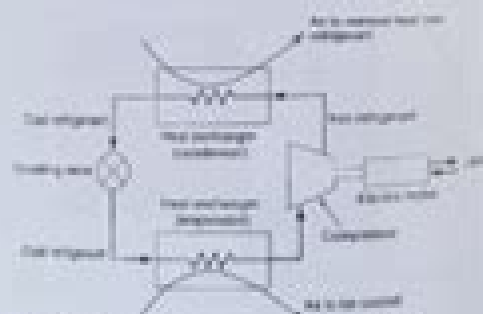

FIGURE 1.2 Schematic of a vapor-compression refrigeration cycle.

FIGURE 1.3 Schematic of a building showing heat transfer.

It is a simple task, consider a cooling system used in a computer (Figure 1.4). The computer chips and power supply must be cooled so that the reliability of the system is not compromised. One common cooling approach is to force air through the computer case to remove unwanted heat. A thermodynamic analysis of such a case, power supply, and compressor will tell us the amount of energy that must be removed from the computer case so that the temperature of the air entering the computer case will not exceed a given limit. That analysis would tell us the size of the fan, the size of the cooling coil, and the size of the duct needed to distribute the cooled air throughout the computer case.

1.2 THERMAL AND FLUID SYSTEMS ANALYSIS AND ENGINEERING

Additional examples, similar to those given in the previous section, can be given of large industrial systems (e.g., power plants, oil refineries, chemical processing plants) and related processes (e.g., heat treatment of metals). Heat propagation that would otherwise have thermodynamic, heat transfer, and fluid dynamics are all needed in many design fields. It is the integrated use of these three disciplines that is required for rational and complete analysis of many systems.

Whether the objective is given an assignment to design a new device or modification to an existing process or to predict the performance of a device, the objective of the present course must be very clear. Subsequent, which aspect of the device, process, or system in which we focus must be well defined. A systematic approach to the whole analysis is needed. Figure 1.5 shows a flow diagram of the steps required to take when analyzing and engineering a thermal fluid system. We always begin with the physical system (e.g., the engine of a car). Then we model. The engineer's job is, first, to translate the physical system into a physical model and, second, to describe the physical model with a mathematical model. The actual physical system may be so complex that it is impossible to fully describe each part within process. However, we require that there be a model, a picture, or picture that we can use to describe the system sufficiently so that it can be modeled. Once a physical model is developed, then physical laws that govern the process (e.g., a force, momentum, mass, or energy balance) are used to create the
