dihybrid cross is a cross between two individuals with two observed traits that are controlled by two distinct genes the idea

of a dihybrid cross came from Gregor Mendel when he observed pea plants that were either yellow or green and either round or wrinkled. Crossing of two heterozygous individuals will result in predictable ratios for both genotype and phenotype in the offspring. The expected phenotypic ratio of crossing heterozygous parents would be 9:3:3:1. Deviations from this ratio can occur due to various factors.
