Model-Based Control of Flying Robots for Robust Interaction Under Wind Influence Teodor Tomić,2022-10-07

This book addresses the topic of autonomous flying robots physically interacting with the environment under the influence of wind. It aims to make aerial robots aware of the disturbance interaction and faults acting on them. This requires reasoning about the external wrench force and torque acting on the robot and distinguishing between wind interactions and collisions. The book takes a model based approach and covers a systematic approach to parameter identification for flying robots. The book aims to provide a wind speed estimate independent of the external wrench including estimating the wind speed using motor power measurements. Aerodynamics modeling is approached in a data driven fashion using ground truth measurements from a 4D wind tunnel. Finally the book bridges the gap between trajectory tracking and interaction control to allow physical interaction under wind influence. Theoretical results are accompanied by extensive simulation and experimental results.

Nonlinear Control of Vehicles and Robots Béla Lantos,Lőrinc Márton,2010-12-01 Nonlinear Control of Vehicles and Robots develops a unified approach to the dynamic modeling of robots in terrestrial aerial and marine environments. The main classes of nonlinear systems and stability methods are summarized and basic nonlinear control methods useful in manipulator and vehicle control are presented. Formation control of ground robots and ships is discussed. The book also deals with the modeling and control of robotic systems in the presence of non smooth nonlinearities. Robust adaptive tracking control of robotic systems with unknown payload and friction in the presence of uncertainties is treated. Theoretical and practical aspects of the control algorithms under discussion are detailed. Examples are included throughout the book allowing the reader to apply the control and modeling techniques in their own research and development work. Some of these examples demonstrate state estimation based on the use of advanced sensors as part of the control system.

Robotic Manipulators and Vehicles Gerasimos Rigatos,Krishna Busawon,2018-05-24 This monograph addresses problems of nonlinear control estimation and filtering for robotic manipulators multi degree of freedom rigid link robots flexible link robots underactuated redundant and cooperating manipulators and closed chain robotic mechanisms and nonlinear control estimation and filtering for autonomous robotic vehicles operating on the ground in the air and on and under water independently and in cooperating groups. The book is a thorough treatment of the entire range of applications of robotic manipulators and autonomous vehicles. The nonlinear control and estimation methods it develops can be used generically being suitable for a wide range of robotic systems. Such methods can improve robustness precision and fault tolerance in robotic manipulators and vehicles at the same time as enabling the reliable functioning of these systems under variable conditions model uncertainty and external perturbations.

Modularity in Motor Control: From Muscle Synergies to Cognitive Action Representation Andrea d'Avella, Martin Giese, Yuri P Ivanenko, Thomas Schack, Tamar Flash, 2016-04-21 Mastering a rich repertoire of motor behaviors as humans and other animals do is a surprising and still poorly understood outcome of evolution development and learning Many degrees of freedom non linear dynamics and sensory delays provide formidable challenges for controlling even simple actions Modularity as a functional element both structural and computational of a control architecture might be the key organizational principle that the central nervous system employs for achieving versatility and adaptability in motor control Recent investigations of muscle synergies motor primitives compositionality basic action concepts and related work in machine learning have contributed to advance at different levels our understanding of the modular architecture underlying rich motor behaviors However the existence and nature of the modules in the control architecture is far from settled For instance regularity and low dimensionality in the motor output are often taken as an indication of modularity but could they simply be a byproduct of optimization and task constraints Moreover what are the relationships between modules at different levels such as muscle synergies kinematic invariants and basic action concepts One important reason for the new interest in understanding modularity in motor control from different viewpoints is the impressive development in cognitive robotics In comparison to animals and humans the motor skills of today's best robots are limited and inflexible However robot technology is maturing to the point at which it can start approximating a reasonable spectrum of isolated perceptual cognitive and motor capabilities These advances allow researchers to explore how these motor sensory and cognitive functions might be integrated into meaningful architectures and to test their functional limits Such systems provide a new test bed to explore different concepts of modularity and to address the interaction between motor and cognitive processes experimentally Thus the goal of this Research Topic is to review compare and debate theoretical and experimental investigations of the modular organization of the motor control system at different levels By bringing together researchers seeking to understand the building blocks for coordinating many muscles for planning endpoint and joint trajectories and for representing motor and behavioral actions in memory we aim at promoting new interactions between often disconnected research areas and approaches and at providing a broad perspective on the idea of modularity in motor control We welcome original research methodological theoretical review and perspective contributions from behavioral system and computational motor neuroscience research cognitive psychology and cognitive robotics [Robots, Drones, UAVs and UGVs for Operation and Maintenance](#) Diego Galar, Uday Kumar, Dammika Seneviratne, 2020-05-07 Industrial assets such as railway lines roads pipelines are usually huge span long distances and can be divided into clusters or segments that provide different levels of functionality subject to different loads degradations and environmental conditions and their efficient management is
