The Cell Cycle - Mitosis

Stages of the Cell Cycle (I - PMAT - C)

Interphase
Interphase has three parts - G₁, S, and G₂. The cell grows during G₁, replicates DNA during S, and prepares for division during G₂.

Mitosis begins

Prophase
Chromatin condenses into visible chromosomes. In prokaryotes, transcription and translation occur simultaneously. In eukaryotes, transcription occurs in the nucleus and translation occurs in the cytoplasm. Spindle fibers begin to form.

Metaphase
Chromosomes line up along the equator of the cell. Each chromosome consists of two sister chromatids. Spindle fibers attach to the centromeres.

Anaphase
Sister chromatids are pulled apart. The chromatids are now considered daughter chromosomes. They move toward opposite poles of the cell and become visible.

Telophase
The chromosomes reach the poles of the cell. Nuclear envelopes form around the two sets of chromosomes.

Cytokinesis

Cell Growth

Most cells are very small, between 1-100 µm in diameter. (For comparison, a strand of human hair is 70 µm in width.) Cells are small because they are limited by their surface area to volume ratio. As a cell grows, its volume increases faster than its surface area. It begins to have difficulty transporting nutrients and waste. By remaining small, cells can manage a more efficient internal transport and communication system, that means that when a cell reaches its size limit, it must either stop growing or divide. The process of growing and dividing is known as the cell cycle.

Prokaryotic Cell Cycle
Prokaryotic cells have a single circular chromosome. They reproduce by binary fission, which involves the replication of the single chromosome and the division of the cell into two daughter cells with the same genetic material.

Eukaryotic Cell Cycle
Eukaryotic cells have a nucleus and multiple linear chromosomes. They reproduce by mitosis, which involves the replication of the chromosomes and the division of the cell into two daughter cells with the same genetic material.

The Purpose of Mitosis
The purpose of mitosis is to form identical daughter cells. Somatic cells are cells that make up the body of an organism. Mitosis creates the new cells that allow an organism to grow and, in adults, it also creates new cells to replace damaged cells. For example, the skin has a cell, existing skin cells divided into new cells.
