

Chemical Equilibrium

NAME _____ DATE _____

Introduction

Chemical equilibrium is a state in which the concentrations of reactants and products remain constant over time. This occurs when the forward and reverse reaction rates are equal.

Le Chatelier's Principle states that if a system at equilibrium is subjected to a change in concentration, temperature, or pressure, the system will shift to counteract the change.

For example, if the concentration of a reactant is increased, the system will shift to the right to produce more products and reduce the concentration of the reactant.

Similarly, if the temperature is increased for an exothermic reaction, the system will shift to the left to absorb the added heat.

Pressure changes affect equilibrium only for reactions involving gases. Increasing the pressure will shift the system towards the side with fewer moles of gas.

Understanding chemical equilibrium is essential for predicting the behavior of chemical systems under various conditions and for optimizing industrial processes.

This document provides a comprehensive overview of the principles governing chemical equilibrium, including the effects of concentration, temperature, and pressure.

By applying these principles, chemists can predict the direction of equilibrium shifts and calculate the equilibrium constants for various reactions.
