Variational Methods in Nuclear Reactor Physics Weston M. Jr. Stacey, 2012-12-02 Nuclear Science and Technology Volume 10 Variational Methods in Nuclear Reactor Physics presents the mathematical methods of a variational origin that are useful in obtaining approximate solutions to science and engineering problems This book is composed of five chapters and begins with a discussion on the variation principles for physical systems described by both inhomogeneous and homogeneous equations to develop a generalized perturbation theory Chapter 2 deals with the applications of variational estimates and generalized perturbation theory to neutron transport problems Chapter 3 covers the variation principles of the Lagrangian form that are constructed for a general linear time dependent process and for the specific case of the P1 neutron kinetics equations Chapter 4 presents the general procedure for the variational derivation of synthesis approximations and their applications to problems in reactor physics This chapter also examines the relationship of the spatial synthesis and finite element method and a hybrid method that combines features of both methods Chapter 5 describes the relationship of variation theory with the Hamilton Jacobi theory and with the optimization theories of the maximum principle and dynamic programming Nuclear physicists and researchers will find this text invaluable

Computing Methods I. S. Berezin, N. P. Zhidkov, 2014-05-16 Computing Methods Volume 2 is a five chapter text that presents the numerical methods of solving sets of several mathematical equations This volume includes computation sets of linear algebraic equations high degree equations and transcendental equations numerical methods of finding eigenvalues and approximate methods of solving ordinary differential equations partial differential equations and integral equations The book is intended as a text book for students in mechanical mathematical and physics mathematical faculties specializing in computer mathematics and persons interested in the theory and practice of numerical methods

Fluid and Thermodynamics Kolumban Hutter, Yongqi Wang, 2016-06-10 This first volume discusses fluid mechanical concepts and their applications to ideal and viscous processes It describes the fundamental hydrostatics and hydrodynamics and includes an almanac of flow problems for ideal fluids The book presents numerous exact solutions of flows in simple configurations each of which is constructed and graphically supported It addresses ideal potential Newtonian and non Newtonian fluids Simple yet precise solutions to special flows are also constructed namely Blasius boundary layer flows matched asymptotics of the Navier Stokes equations global laws of steady and unsteady boundary layer flows and laminar and turbulent pipe flows Moreover the well established logarithmic velocity profile is criticised

Numerical Methods for Roots of Polynomials - Part II J.M. McNamee, V.Y. Pan, 2013-07-19 Whereas Newton's method involves only the first derivative methods discussed in this chapter involve the second or higher The classical methods of this type such as Halley's Euler's Hansen and Patrick's Ostrowski's Cauchy's and Chebyshev's are all third order with three evaluations so are slightly more efficient than Newton's method Convergence of some of these methods is discussed as well as composite variations some of which have fairly high efficiency We describe special methods for multiple roots simultaneous or interval methods and acceleration techniques We treat Laguerre's method which is known to be globally convergent for all real roots The Cluster Adapted Method is useful for multiple or near multiple roots Several composite methods are discussed as well as methods using determinants or various types of interpolation and Schroeder's method

Hexaflexagons and Other Mathematical Diversions Martin Gardner, 2020-10-05 Martin Gardner's Mathematical Games columns in Scientific American inspired and entertained several generations of mathematicians and scientists Gardner in his crystal clear prose illuminated corners of mathematics especially recreational mathematics that most people had no idea existed His playful spirit and inquisitive nature invite the reader into an exploration of beautiful

mathematical ideas along with him These columns were both a revelation and a gift when he wrote them no one before Gardner had written about mathematics like this They continue to be a marvel This volume originally published in 1959 contains the first sixteen columns published in the magazine from 1956 1958 They were reviewed and briefly updated by Gardner for this 1988 edition **Nonlinear Processes in Engineering** ,1974-09-20 In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems A number of computing techniques are considered such as methods of operator approximation with any given accuracy operator interpolation techniques including a non Lagrange interpolation methods of system representation subject to constraints associated with concepts of causality memory and stationarity methods of system representation with an accuracy that is the best within a given class of models methods of covariance matrix estimation methods for low rank matrix approximations hybrid methods based on a combination of iterative procedures and best operator approximation and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression Best operator approximation Non Lagrange interpolation Generic Karhunen Loeve transform Generalised low rank matrix approximation Optimal data compression Optimal nonlinear filtering Numerical Recipes in FORTRAN 77: Volume 1, Volume 1 of Fortran Numerical Recipes William H.
