ABSTRACT

Natural disasters generate profound socio-economic changes in the affected communities. A consistent methodology that allows quantifying its impacts is essential for the implementation of adaptation and mitigation policies. The objective of this work is to provide a systematic review of existing methodologies to quantify the economic impact derived from the occurrence of natural disasters. To do this, a keyword search is conducted in two search engines (Scopus and Science Direct).

The results suggest the existence of wide differences between methodological proposals. Consideration of physical damage (direct effect) is more frequent than the impact on productive flows (indirect effect). The destruction of the natural environment (loss of ecosystem services) is not usually included. In the context of global climate change, these findings highlight the importance of having a consistent methodology.

KEY-WORDS: Natural disasters; Economic impact.

INTRODUCTION

Natural disasters constitute a serious threat at the global level. Every year an increasing number of natural disasters take place (Center for Research on the Epidemiology of Disasters [CRED], 2020) and this is expected to deepen in the future as a consequence of climate change (Intergovernmental Panel on Climate Change [IPCC], 2018). During 2018 alone, natural disasters affected 68.5 million people worldwide -with an estimated mortality of more than 11,000 people- and generated losses of US \$ 132 billion (CRED, 2019).

The occurrence of natural disasters involves profound changes in the living conditions of the affected communities (Economic Commission for Latin America and the Caribbean
