

Nature, Nurture and Human Diversity

Myers, D. (2010) Psychology Worth: New York

CHAPTER PREVIEW

Members of the human family share common behavioral tendencies but are also strikingly diverse. To what extent are we shaped by our heredity and to what degree by our life history? The conclusions— that nature is crucially important and that nurture is crucially important—are central to today's psychology.

Genes provide the blueprints that design both our universal human attributes and our individual traits. Behavior geneticists explore individual differences. By using twin, adoption, and temperament studies, they assess the heritability of various traits and disorders. Their research indicates that both nature and nurture influence our life courses. We are products of interactions between our genetic predispositions and our surrounding environments. Molecular geneticists search for genes that put people at risk for genetically influenced disorders, which has potential benefits as well as risks.

Evolutionary psychologists focus on what makes us alike as humans. They study how natural selection favored behavioral tendencies that contributed to the survival and spread of our genes. For example, in explaining gender differences in sexual behavior, they argue that women most often send their genes into the future by pairing wisely, men by pairing widely. Critics maintain that evolutionary psychologists make too many hindsight explanations and underestimate the role of culture.

We'll be studying these aspects of human diversity and more as we look at what makes humans human and contemplate the nature vs. nurture debate.

CHAPTER OBJECTIVES

After students have completed their study of this chapter, they should be able to:

1. Give examples of differences and of similarities within the human family, noting how they are shaped by our genes and our environment.
2. Identify the types of questions that interest behavior geneticists, and describe the elements of heredity: *chromosome*, *DNA*, *gene*, and *genome*.
3. Describe how twin and adoption studies help us differentiate hereditary and environmental influences on human behavior.
4. Discuss how the relative stability of our temperament illustrates the influence of heredity on development.
5. Explain what is meant by heritability, and give examples of the interaction of genes and environment on specific traits.
6. Identify the potential uses of molecular genetics research.
