

For the output to turn the same direction as the input, a third gear is added.

From Engine

To Driveshaft

The Cluster (Counter) Gear Enables the Output to Spin The Same Way as the Input.

The smaller gear on the left has 16 teeth.

It is driving the larger gear on the right that has 32 teeth.

The 16 tooth driving gear is turning with 10 pounds of torque. But it rotates twice for every rotation of the 32 tooth Driven gear for a 2:1 Ratio

These Gears spin freely and independently if the synchronizer sleeve isn't locked to either gear by these Engagement Teeth.

The input and output shafts spin separately -- they are connected to the cluster gear by way of the synchronizer sleeve, which is moved by the shift fork that slides two gears. As each gear is engaged, the cluster/counter gear transfers torque to the output.
