INTRODUCTION

Endoscopic stone surgery has gone through rapid technological advances in the last decade with the development of next-generation holmium lasers. These systems allow the user to adjust multiple parameters that can optimize fragmentation efficiency during ureteroscopy (URS). Parameters include an increased range in pulse energy (PE), frequency (Fr), and manipulation of the pulse duration (PD). More recently, introduction of pulse modulation with the Moses Technology™ provides pulse modulation with energy delivered over two pulses. In light of these developments, it may be difficult for the urologist to understand how to best utilize laser settings in the modern era. We provide an overview of how PE, Fr, and PD affect three different aspects of laser lithotripsy performance: (A) Fragmentation, (B) Stone retropulsion, and (C) Laser fiber-tip degradation (Table 1).

PULSE ENERGY

PE is the optical energy emitted from the laser fiber-tip during one pulse and is measured in joules (J). The PE can vary from 0.2 to 6.0 J and is dependent on the power of the holmium system. Low-power systems (e.g., 20 W) have traditionally had more limited PE power ranges than high-power systems. Factors that influence the selection of PE include stone density, location, and desired fragment size, with commonly utilized settings during URS ranging from 0.2 to 2 J. (A) Fragmentation: Increasing the PE leads to more fragmentation, with hard stones like calcium oxalate monohydrate usually requiring greater PE (1). Higher PE settings such as 1.0 J are ideal for lithotripsy followed by active basket retrieval. Low PE (LoPE) is employed when utilizing a dusting technique to create very small fragments that are left *in situ* for spontaneous passage. An *in-vitro* study found that using a LoPE setting of 0.2 J leads to the smallest fragment sizes (1) but harder stones such as calcium oxalate monohydrate may require higher PE. In our practice we start dusting settings at 0.2 or 0.3 J and increase the energy accordingly based on how much powder is coming off the stone. (B) Stone retropulsion: On activation of pulsed laser energy, the surrounding fluid evaporates and expands, leading to the formation of a vapor bubble. Collapse of this bubble leads to unwanted movement of stone debris, known as retropulsion. PE has a considerable effect on retropulsion, with higher PEs leading to a proportional increase in retropulsion (1). This decreases fragmentation efficiency and increases procedure time by requiring repositioning of the fiber-tip to maintain contact with the stone, and in the worst-case scenario, a ureteral stone may migrate

New Technologies in Urology Prokar Dasgupta, John M. Fitzpatrick, Roger Kirby, Inderbir S. Gill, 2010-01-13 Technology seems to be an integral part of modern living Urologists have over the years embraced new technological advances for patient benefit On some occasions however the initial enthusiasm in something new has failed to endure rigorous scientific scrutiny Thus while being technological leaders we urologists know better than most other surgical specialties that what is new is not necessarily good This textbook is aimed at urologists and surgeons at all levels and has contributions from international experts The topics vary from robotics to lasers to single port laparoscopy The comprehensive chapters should be of equal interest to uro oncologists and those involved in treating benign urological diseases While the contents are meant to bring the reader up to date with technological advances the authors have attempted to balance their enthusiasm with basic science translational research and clinical outcomes It will be obvious that some of the subjects mentioned here such as nanotechnology are still evolving and it will be a while before they undergo clinical trials that establish their position in clinical medicine We hope you enjoy reading this book as much as we have enjoyed creating it London UK Prof Prokar Dasgupta Dublin Ireland Prof John Fitzpatrick London UK Prof Roger Kirby CA
