Advances in Cell Biology
David M. Prescott, 2013-06-29 Advances in Cell Biology has been initiated as a continuing multi volume series to report on the progress of a wide spectrum of problems of cell structure and cell function In arranging these volumes individual contributors are asked not only to review the major new information but especially to present the state of a given problem or area by discussing the current central issues speculations concepts hypotheses and technical problems We intend in addition that these volumes will not be concerned with comprehensive reviews of the recent literature but will consist rather of presentations of an interpretive and integrative nature based on selection of major research advances It is our aim that these volumes should provide the means whereby cell biologists may keep themselves reasonably well informed about the current progress in research areas in cell biology in which they are not immediately or directly involved themselves The articles nevertheless are expected to bring into focus the experimental objectives of the specialists in a given research area D M P L G E M vii Contents Contributors v Preface vii 1 1 The Regulation of DNA Synthesis in Eukaryotes James Douglas Watson 2 D RNA Containing Ribonucleoprotein Particles and Messenger RNA Transport 47 G P Georgiev and O P Samarina Recent Developments in the Synchronization of 3 Tetrahymena Cell Cycle 111 Eric Zeuthen 153 4 Repetitious DNA Christopher Bostock 5 Mitosis 225 R Bruce Nicklas Specific Enzyme Production in Eukaryotic Cells 299 6

Sumner, 2008-04-30 Integrating classical knowledge of chromosome organisation with recent molecular and functional findings this book presents an up to date view of chromosome organisation and function for advanced undergraduate students studying genetics The organisation and behaviour of chromosomes is central to genetics and the equal segregation of genes and chromosomes into daughter cells at cell division is vital This text aims to provide a clear and straightforward explanation of these complex processes Following a brief historical introduction the text covers the topics of cell cycle dynamics and DNA replication mitosis and meiosis the organisation of DNA into chromatin the arrangement of chromosomes in interphase euchromatin and heterochromatin nucleolus organisers centromeres and telomeres lampbrush and polytene chromosomes chromosomes and evolution chromosomes and disease and artificial chromosomes Topics are illustrated with examples from a wide variety of organisms including fungi plants invertebrates and vertebrates This book will be a valuable resource for plant animal and human geneticists and cell biologists Originally a zoologist Adrian Sumner has spent over 25 years studying human and other mammalian chromosomes with the Medical Research Council UK One of the pioneers of chromosome banding he has used electron microscopy and immunofluorescence to study chromosome organisation and function and latterly has studied factors involved in chromosome separation at mitosis Adrian is an Associate Editor of the journal Chromosome Research acts as a consultant biologist and is also Chair of the Committee of the International Chromosome Conferences The most up to date overview of chromosomes in all their forms Introduces cutting edge topics such as artificial chromosomes and studies of telomere biology Describes the methods used to study chromosomes The perfect complement to Turner *Insect Molecular Genetics* Marjorie A.
