Target Discovery and Validation Reviews and Protocols Mouldy Sioud, 2008-02-04 Target discovery is a field that has existed for several years but is so vibrant today because of the recent progress in our understanding of the molecular mechanisms of many human diseases and the technical advances in target identification and validation More sophisticated gene profiling technologies such as DNA microarrays and serial analysis of gene expression permit rapid identification of lead targets Moreover analysis of gene networks in living organisms allows the identification of target genes that operate in defined physiological pathways With the sequencing of several genomes completed and the rapidly growing gene expression databases there is now greater impetus than ever before for in silico discovery of therapeutic targets Also recent advances in genetic technologies have increased our ability to generate mouse models for human diseases The implications of these genetically modified animals in drug development are several including identification of new drug targets predicting efficacy and uncovering possible side effects Together these recent technical advances should allow researchers to make the most informed choice early and advance the chosen targets toward clinical studies Regarding cancers any difference between a cancer and a normal cell could potentially be exploited as a therapeutic target The hope is that drugs targeting specific constituents or pathways in cancer cells will provide more effective therapy either alone or in combination with other currently used anticancer drugs In addition to drug targets identifying new target antigens remains as much of a challenge as improving tumor vaccines already

Glycobiology Protocols Inka Brockhausen,2008-02-04 Glycobiology involves studies of complex carbohydrates and posttrans tional

modifications of proteins and has become an important interdisciplinary field encompassing chemistry, biochemistry, biology, physiology and pathology. Although initial research was directed toward elucidation of the different carbohydrate structures and the enzymes synthesizing them, the field has now moved toward identifying the functions of carbohydrates. The protocols described in *Glycobiology Protocols* form a solid basis for investigations of glycan functions in health and disease. The cloning of many of the genes participating in glycosylation processes has helped to enhance our knowledge of how glycosylation is controlled but has also added another dimension of complexity to the great heterogeneous variety of the structures of the oligosaccharides of glycoproteins, proteoglycans and glycolipids. A family of similar enzyme proteins exists for each glycosylation step. Glycosyltransferases are extremely specific for both the nucleotide sugar donor and the acceptor's structure but many other factors control sugar transfer including the localization and topology of enzymes, cofactors, possible chaperone proteins and the availability of sugar acceptor substrates. The analysis of the intracellular organization of glycosylation and of the factors controlling the activities of the participating enzymes in the cell are important areas that need more research efforts. Another challenge for future research is to understand the glycodynamics of a cell that is how the cell responds to stimuli leading to biological and pathological changes in terms of alterations in glycosylation and how this affects the biology of the cell.
