*Prediction of the Environmental Fate of Chemicals* Y. Samiullah, 2012-12-06 Concern over the effects of chemicals in the environment has been increasing for many years Environmental contamination by DDT Aldrin Dieldrin mercury PCBs organotins and many other substances are all part of the public consciousness and have led to widespread attention to this topic Some of the concerns have arisen because human health has been affected when contaminants have been consumed via the food chain for instance in the case of Minamata disease in Japan In other cases direct effects on other components of ecosystems have given cause for alarm The toxic effects which any chemical can cause are a function of exposure and innate toxicity i.e. of the ability to reach in sufficient quantity a site where a biological process can be disrupted and of the tendency to cause disruption when it gets there The processes by which chemicals reach sites of toxic action are the subject of this book and are a fundamental consideration in ecotoxicology When a chemical enters the environment e.g. via a spillage or in an effluent it is potentially subject to a wide variety of processes which may eliminate it from the environment completely modify it into a more or less harmful substance or transfer it to another part of the environment The processes involved are complex and highly variable but it is essential to increase our understanding of them

*Produced Water* Kenneth Lee, Jerry Neff, 2011-09-18 A state of the art review of scientific knowledge on the environmental risk of ocean discharge of produced water and advances in mitigation technologies In offshore oil and gas operations produced water the water produced with oil or gas from a well accounts for the largest waste stream in terms of volume discharged Its discharge is continuous during oil and gas production and typically increases in volume over the lifetime of an offshore production platform Produced water discharge as waste into the ocean has become an environmental concern because of its potential

contaminant content Environmental risk assessments of ocean discharge of produced water have yielded different results For example several laboratory and field studies have shown that significant acute toxic effects cannot be detected beyond the point of discharge due to rapid dilution in the receiving waters However there is some preliminary evidence of chronic sub lethal impacts in biota associated with the discharge of produced water from oil and gas fields within the North Sea As the composition and concentration of potential produced water contaminants may vary from one geologic formation to another this conference also highlights the results of recent studies in Atlantic Canada Books in Print Supplement ,2002
