Behavioral and Physiological Bases of Attentional Biases: Paradigms, Participants, and Stimuli Daniela M.

Pfabigan, Ulrich S. Tran, 2015-08-21 Attentional biases ABs play a prominent role in the development and maintenance of clinically relevant symptoms of for example anxiety and depression In particular increased attentional orienting and preoccupation with biologically relevant and mood congruent stimuli has been observed suggesting that the visual attentional system is overly sensitive towards threat cues and avoidant of cues of reward in these disorders First several experimental paradigms have been used to assess ABs e g the dot probe task the emotional stroop task and the spatial cueing task amongst others Yet these paradigms are based on different theoretical backgrounds and target different stages of the attentional process Thus different paradigms provided converging as well as diverging evidence with regard to ABs However it is often not entirely clear to what extent this reflects real differences and commonalities or is caused by differences in methodology For example behavioral reaction time data can only provide a snapshot of selective attention Measuring event related potentials eye movements or functional brain imaging data enables exploring the exact temporal and spatial dynamics of attentional processes Moreover neuroimaging data reveal specific cortical networks involved in directing attention toward a stimulus or disengaging from it Second ABs have been mainly discussed as symptoms of psychopathology while results in healthy participants are still scarce previous studies mostly compared extreme groups However a comprehensive theoretical and empirical account of ABs in psychopathology also requires a thorough account of ABs in the general healthy population Moreover the effect of gender as an important contributing factor in processing of emotional stimuli has also not been considered systematically in previous research Third a variety of stimuli has been used in the assessment of ABs So far mostly facial or word stimuli have been applied However in everyday life not only facial emotion recognition but also a fast evaluation of complex social situations is important to be effective in social interactions Recent research started using more complex stimuli to raise ecological validity However the use of ecologically valid stimuli poses some methodological challenges and needs to be applied more systematically The aim of this research topic is to integrate different paradigms and stimuli addressing individuals from the whole range of the population continuum and to apply different methodological approaches It is intended to bring together expertise in stimulus selection timing and implementing issues advancing and broadening the overall understanding of ABs

Guidelines We are now entering the third decade of the 21st Century and especially in the last years the achievements made by scientists have been exceptional leading to significant advancements in the fast growing field of Cognitive Neuroscience Frontiers have organized a series of Research Topics to highlight the latest advancements in research across the field of Cognitive Neuroscience This editorial initiative of relevance led by Dr Kida Associate Editor of the Cognitive Neuroscience section together with Dr Okamoto Associate Editor of both the Brain Imaging and Sensory Neuroscience sections is focused on new insights novel developments current challenges latest discoveries recent advances and future perspectives in the field of the Cognitive Neuroscience of attention **Augmentation of Brain Function: Facts, Fiction and Controversy** Mikhail Lebedev,Ioan Opris,Manuel F. Casanova ,2018-09-14 Volume I entitled Augmentation of Brain Functions Brain Machine Interfaces is a collection of articles on neuroprosthetic technologies that utilize brain machine interfaces BMIs BMIs strive to augment the brain by linking neural activity recorded invasively or noninvasively to external devices such as arm prostheses exoskeletons that enable bipedal walking means of communication and technologies that augment attention In addition to many practical applications BMIs provide useful research tools for basic science Several articles cover challenges and controversies in this rapidly developing field such as ways to improve information transfer rate BMIs can be applied to the awake state of the brain and to the sleep state as well BMIs can augment action planning and decision making Importantly BMI operations evoke brain plasticity which can have long lasting effects Advanced neural decoding algorithms that utilize optimal feedback controllers are key to the BMI performance BMI approach can be combined with the other augmentation methods such systems are called hybrid BMIs Overall it appears that BMI will lead to many powerful and practical brain augmenting technologies in the future Beyond the simple contrastive analysis: Appropriate experimental approaches for unraveling the neural basis of conscious experience Jaan Aru,Talis Bachmann,2015-06-26 Contrasting conditions with and without conscious experience has served consciousness research well However research based on this simple contrast has led to controversies about the neural basis of conscious experience One key reason for these ongoing debates seems to be that the simple contrast between conditions with and without consciousness is not specific for unraveling the neural basis of conscious experience but rather also leads to other processes that precede or follow it Acknowledging this methodological problem implies that some of the previous research findings about the neural underpinnings of conscious experience are

actually reflecting the prerequisites and consequences rather than the direct correlates of conscious perception. Thus it is required to re-evaluate the previous results to find out which of them are telling us anything about the neural basis of consciousness. But first and foremost to overcome this methodological problem we need new experimental paradigms that go beyond the simple contrastive analysis or find the ways how some older but well forgotten paradigms may foster a new look at this emerging problem. Accordingly this research topic is looking for empirical and theoretical contributions that 1 envision new and suitable experimental approaches to study consciousness that are free from the limitations of the simple contrastive analysis 2 provide empirical data that help to separate the neural correlates of conscious experience from the prerequisites and consequences of it 3 help to re-assess previous research findings about the neural correlates of conscious perception in the light of the methodological problems with the traditional contrastive analysis. We hope that the theoretical insights and experimental approaches collected within this Research Topic help us to gain a more refined understanding of the neural basis of conscious experience.

Neurophysiology in Alzheimer's Disease and Dementia Davide Vito Moretti, 2016-09-06

Alzheimer's disease AD and dementia are the most common neurodegenerative disorder. Since the number of individuals with AD and dementia is expected to increase considerably in the near future, reliable treatment and diagnosis are critical. EEG and neurophysiological technique could be used as a cost-effective screening tool for early detection and diagnosis in the Mild Cognitive Impairment (MCI) stage. The aim in neurophysiology research is to develop signal processing methods that improve the specificity for diagnosing dementia; we wish to discover signal features that not only significantly differ in AD patients but also allow us to reliably separate AD patients and control subjects. This approach is valuable for clinical purposes as a diagnostic tool for dementia and it also more fundamentally contributes to a better understanding of brain dynamics of MCI patients. Finally, the development of neurophysiological biomarkers could be useful in monitoring pharmacological treatments. The main focus of this special issue will be on the most recent developments and ideas in the field of EEG and neurophysiology which will enable us to extract features that improve the specificity for diagnosing AD and dementia.
