WHAT IS A PROGRAMMER?

...an Explanation for Householders (as recommended by the Energy Savings Trust)

Programmers allow you to set ON and OFF time periods. Some models allow the central heating to operate for some or all of the day/night, while others allow the domestic hot water and heating to come on and go at a chosen time. Setting ON and OFF time periods to suit your needs. For some programmers you may also choose you can be heating without water to run continuously, but under the longer ON and OFF heating periods, or be particularly at the time of the programmer that is correct. Some have had to be added to appropriate space or be changed before because they have broken before time. For the best results it is important to follow the heating programme. For example, if you have a boiler, it is better to have a boiler that is not running than to have a boiler that is not running. The heating will not work if the boiler has not been set for heating. If you have a hot water cylinder, the water heating will not work if the cylinder is not set for heating. The hot water has reached the correct temperature.

WHAT IS A ROOM THERMOSTAT?

...an Explanation for Householders (as recommended by the Energy Savings Trust)

A room thermostat controls the heating system in a room. It works by sensing the air temperature, switching on the heating when the air temperature falls below the demand setting, and switching it off when the air temperature has risen to the set temperature. Setting a room thermostat to a higher setting will increase the room heat as the heater will supply the room heat as required in the design of the heating system. For example, the use of a room thermostat, together with the setting of the boiler, controls the room heat. Setting a room thermostat to a lower setting will result in the room being controlled at a lower temperature, and saving energy. The heating system will not work if a room thermostat is programmed to switch it off. The way to use and use your room thermostat is to set the room temperature setting for the room you want to heat, and then leave it alone to do its job. The best way to do this is to set the room thermostat to a low temperature - say 16°C - and then turn it up to the degree you want the room to be comfortable with the temperature. You must leave it alone to do its job. The thermostat will adjust the room heating, and save energy, and cost you more money.

If your heating system is a boiler with radiators, there will usually be only one room thermostat to control the whole house. As you can have different temperatures in different rooms by setting roomset radiator valves (often in individual radiators). You can have this, you should choose a programmer that is appropriate for the whole house. If you have this, you can choose a night regime setting to make sure that your cylinder runs continuously, then prevent any unnecessary cylinder runs by setting the 15°C.

Room thermostats need a free flow of air to sense the temperature. So they must not be covered by curtains, it is important to have the thermostat in the room, and it is also important to have the thermostat in the room properly.

Energy Efficiency and the Environment

Home energy use is responsible for more than 1/3 of the total UK carbon emissions which contribute to climate change. Heating and hot water systems based on fossil fuels account for 1/4 of this figure, so it is important to understand how your controls can help to maximise energy efficiency while maintaining your comfort.

Your Programmer should be used in conjunction with appropriate temperature controls. In order to save energy the following general points should be observed:

1. Ensure your system contains a room thermostat and a hot water thermostat, and that both are set to appropriate temperature levels: typically 18°C for the room temperature and between 55 - 60°C for the hot water temperature.
2. Programme your heating and hot water to be off when you are not in the house. If you are concerned about possible heat damage to any exposed pipework, it is advisable to fit a hot protection system - your installer can advise you about this.
3. Think about how you use your domestic hot water - if you have a storage system, it is not necessary to have this switched on all the time, even when you are in the house.
4. Consider the heat up time required for your central heating. Every home responds differently when the heating is switched on. Adjust the start time so that you are not cold when you get up in the morning. A longer heat up time is required for other heating periods.
5. In the evening, when the house is up to temperature, it is often possible to switch off the heating system at least before you go to bed, without any noticeable reduction in comfort.

Instrumentation Systems is the first book to combine coverage of these two integral aspects of running a chemical processing plant. It helps engineers from various disciplines learn how various analysis techniques, international standards, and instrumentation and controls provide layers of protection for basic process control systems and how, as a result, overall system reliability, availability, dependability, and maintainability can be increased. This step-by-step guide takes readers through the development of safety instrumented systems, also including discussions on cost impact, basics of statistics, and reliability. Swapan Basu brings more than 35 years of industrial experience to this book, using practical examples to demonstrate concepts. Basu links between the SIS requirements and process hazard analysis in order to complete SIS lifecycle implementation and covers safety analysis and realization in control systems with up-to-date descriptions of modern concepts such as SIL, SIS, and Fault Tolerance, to name a few. In addition, the book addresses security issues that are particularly important for programmable systems in modern plants and discusses at length hazardous atmospheres and their impact on electrical enclosures and the use of IS circuits. Helps the reader identify which hazard analysis method is the most appropriate. Covers ALARP, HAZOP, FMEA, LOPA. Provides tactics on how to implement standards such as IEC 61508, 61511, and ANSI ISA 84. Presents information on how to conduct safety analysis and realization in control systems and safety instrumentation.
