Assay for Photoreactivity OECD,2019-06-18 Phototoxicity is defined as a toxic response is elicited by topically or systemically administered photoreactive chemicals after the exposure of the body to environmental light Several classes of photoreactive chemicals could cause phototoxic reactions when activated by light at otherwise non toxic doses Phototoxicity can be categorized as photoirritation photoallergy and photogenotoxicity The purpose of this test is to measure the phototoxicity of a chemical The main event in any phototoxic reaction is the absorption of photons of a wavelength that induces the excitation of the chromophore Excitation energy is often transferred to oxygen molecules followed by the generation of ROS reactive Oxygen Species Measurements are performed using a spectrometer The determination of the ROS generation from irradiated chemicals with simulated sunlight is indicative of phototoxic potential **Leading Lesson Study** Jennifer Stepanek,Gary Appel,Melinda Leong,Michelle Turner Mangan,Mark Mitchell,2006-12-20 Provides readers with a compelling rationale for the process offers experience tested tools and suggests ways to address commonly occurring challenges This book will assist teachers and those who support them in understanding and implementing all phases of lesson study from initial planning through sharing with others what was learned Dennis Sparks Executive Director National Staff Development Council A powerful teacher professional development process that focuses collaborative teams directly on the classroom and the perfect tool for teachers professional developers and team leaders Gives you everything you need to use lesson study to support teachers in thinking deeply about practice Roberta Jaffe Science Education Coordinator New Teacher Center University of California Santa Cruz Use this team centered approach to directly enhance teaching and learning in your school First introduced in Japan lesson study has gained enthusiastic advocates in US educational circles as a powerful collaborative approach that brings teachers together as researchers into the science and craft of teaching and learning in their classrooms Teachers work as teams to develop a lesson plan teach and observe the lesson to collect data on student learning and use their observations to refine their lesson Participants build their sense of professional authority while discovering effective practices that result in improved learning outcomes for their students This how to guide provides teachers administrators and team leaders with practical strategies models and tools The book leads a beginning team through the phases of the lesson study cycle and provides an experienced team with new perspectives Using examples from U S classrooms this

Test Systems for Detecting Carcinogens K.H. Norpoth, 2012-12-06 The varying cancer incidence from country to country and region to region suggests that environmental factors play a considerable role in the aetiology of cancer Whether these factors in the environment moderate the effect of carcinogenic chemicals or whether they might themselves be carcinogenic is not known at the present time What is known is that there are various chemicals both naturally occurring and man made which can induce cancer in man In the Western world estimates vary as to how much cancer is occupational in origin the figures range from 1% to 40% It is our feeling that probably about 10% of cancer has a direct occupational origin

Nevertheless this number is considerable and it behoves us therefore to identify those chemicals which are carcinogenic and to reduce human exposure Recent work on the mode of action of carcinogenic chemicals suggests that the majority exert their effect through an activation step to give electrophilic metabolites Such metabolites have as a common feature the ability to react with cellular nucleophiles to give covalently bound products Such reaction will occur after carcinogen treatment of animals with nucleic acids particularly in target organs It is reaction with nucleic acids that provides the basis of a number of short term tests for carcinogens since the basic composition of DNA is similar in micro organisms and in human cells A Method for the Identification of Pure Organic Compounds by a Systematic Analytical Procedure Based on Physical Properties and Chemical Reactions Samuel Parsons Mulliken, 1916

Developing a Simple and Rapid Test for Monitoring the Heat Evolution of Concrete Mixtures for Both Laboratory and Field Applications, 2007 Recently activities and interest in monitoring the heat evolution of cement hydration in concrete have increased This is because the development of early age concrete properties such as workability setting time strength gain and thermal cracking resistance is predominantly influenced by the kinetics of cement hydration Various test methods are currently available for measuring heat of cement hydration however most existing methods require expensive equipment complex testing procedures and or extensive time thus making them unsuitable for field application Although ASTM C 186 is used for determining the heat of hydration of cement there is no standard test method for concrete The overall object of this three phase study is to identify develop and evaluate a standard test procedure for monitoring pavement concrete using a calorimetry technique It is envisioned that the newly developed calorimetry test method will be able to verify appropriate concrete proportions to identify potentially incompatible materials and conditions and to predict concrete performance The primary objective of Phase II presented in this report is to establish a standard test procedure as well as the methods for interpreting the calorimeter test results The newly developed calorimeter test is completed more quickly than ASTM C 186 in approximately 24 hours Among a number of uses the test can be utilized as a quality control measure for prescreening concrete materials and a prediction tool for early age cracking The Phase II results demonstrate that the new calorimetry test method has a high potential for detecting concrete incompatibility problems predicting fresh concrete properties such as set time and assessing hardened concrete performance characteristics such as strength gain and thermal cracking
