Extensions of Logic Programming Peter Schroeder-Heister, 1991-02-12 This volume contains finalized versions of papers presented at an international workshop on extensions of logic programming held at the Seminar for Natural Language Systems at the University of Tübingen in December 1989 Several recent extensions of definite Horn clause programming especially those with a proof theoretic background have much in common One common thread is a new emphasis on hypothetical reasoning which is typically inspired by Gentzen style sequent or natural deduction systems This is not only of theoretical significance but also bears upon computational issues It was one purpose of the workshop to bring some of these recent developments together The volume covers topics such as the languages Lambda Prolog N Prolog and GCLA the relationship between logic programming and functional programming and the relationship between extensions of logic programming and automated theorem proving It contains the results of the first conference concentrating on proof theoretic approaches to logic programming

An Introduction to Mathematical Logic Richard E. Hodel, 2013-01-01 This comprehensive overview of mathematical logic is designed primarily for advanced undergraduates and graduate students of mathematics The treatment also contains much of interest to advanced students in computer science and philosophy Topics include propositional logic first order languages and logic incompleteness undecidability and indefinability recursive functions computability and Hilbert's Tenth Problem Reprint of the PWS Publishing Company Boston 1995 edition

On the Logic and Learning of Language Sean A. Fulop, 2004-10-14 This book presents the author's research on automatic learning procedures for categorial grammars of natural languages The research program spans a number of intertwined disciplines including syntax semantics learnability theory logic and computer science The theoretical framework employed is an extension of categorial grammar that has come to be called multimodal or type logical grammar The first part of the book presents an expository summary of how grammatical sentences of any language can be deduced with a specially designed logical calculus that treats syntactic categories as its formulae Some such Universal Type Logic is posited to underlie the human language faculty and all linguistic variation is captured by the different systems of semantic and syntactic categories which are assigned in the lexicons of different languages The remainder of the book is devoted to the explicit formal development of computer algorithms which can learn the lexicons of type logical grammars from learning samples of annotated sentences The annotations consist of semantic terms expressed in the lambda calculus and may also include an unlabeled tree structuring over the sentence The major features of the research include the following We show how the assumption of a universal linguistic component the logic of language is not incompatible with the conviction that every

language needs a different system of syntactic and semantic categories for its proper description The supposedly universal linguistic categories descending from antiquity noun verb etc are summarily discarded Languages are here modeled as consisting primarily of sentence trees labeled with semantic structures a new mathematical class of such term labeled tree languages is developed which cross cuts the well known Chomsky hierarchy and provides a formal restrictive condition on the nature of human languages The human language acquisition mechanism is postulated to be biased such that it assumes all input language samples are drawn from the above syntactically homogeneous class in this way the universal features of human languages arise not just from the innate logic of language but also from the innate biases which govern language learning This project represents the first complete explicit attempt to model the acquisition of human language since Steve Pinker's groundbreaking 1984 publication *Language Learnability and Language Development*

Controlled Natural Language Norbert E. Fuchs, 2010-07-06

Controlled natural languages (CNLs) are subsets of natural languages obtained by restricting the grammar and vocabulary in order to reduce or eliminate ambiguity and complexity. Traditionally, controlled languages fall into two major types: those that prove readability for human readers and those that enable reliable automatic semantic analysis of the language. The second type of languages has a formal logical basis, i.e., they have a formal syntax and semantics and can be mapped to an existing formal language such as first-order logic. Thus, those languages can be used as knowledge representation languages, and writing of those languages is supported by fully automatic consistency and redundancy checks, query answering, etc. Wikipedia. Various controlled natural languages of the second type have been developed by a number of organizations and have been used in many different application domains, most recently within the Semantic Web. The workshop CNL 2009 was dedicated to discussing the similarities and the differences of existing controlled natural languages of the second type, possible improvements to these languages, relations to other knowledge representation languages, tool support, existing and future applications, and further topics of interest.

Artificial Intelligence and the Value Alignment Problem Travis LaCroix, 2025-04-07

Written for an interdisciplinary audience, this book provides strikingly clear explanations of the many difficult technical and moral concepts central to discussions of ethics and AI. In particular, it serves as an introduction to the value alignment problem: that of ensuring that AI systems are aligned with the values of humanity. LaCroix redefines the problem as a structural one, showing the reader how various topics in AI ethics, from bias and fairness to transparency and opacity, can be understood as instances of the key problem of value alignment. Numerous case studies are presented throughout the book to highlight the significance of the issues at stake and to clarify the central role of the value alignment problem in the many ethical challenges facing the development and implementation of AI.
