The diet group was instructed to consume a diet that was 1000 kcal less than their maintenance level. The control group was instructed to consume a diet that was equal to their maintenance level. The subjects were monitored for 10 weeks. The diet group lost significantly more weight than the control group. The diet group also lost significantly more body fat than the control group. The diet group also had a significant improvement in physical fitness compared to the control group. Abstract: The purpose of this study was to determine the effect of a 12-week training program on the physical fitness of 10-year-old children. The study was conducted in a primary school in the city of Ankara, Turkey. The study group consisted of 20 children (10 boys and 10 girls) who were randomly selected from the school. The children were divided into two groups: a control group and an experimental group. The control group did not participate in any physical activity during the study period. The experimental group participated in a 12-week training program that included aerobic, strength, and flexibility exercises. The physical fitness of the children was measured at the beginning and at the end of the study period. The results of the study showed that the experimental group had significantly higher levels of physical fitness than the control group at the end of the study period. The study suggests that a 12-week training program can improve the physical fitness of 10-year-old children.
