

## TOPIC 1- GENETICS

## Definition

- Genetics is the study of heredity and variation.
- Heredity is the passing on/ transmission of characteristics/ traits from the parents to the offspring/ young ones.
- Variation refers to observable differences that are seen in organisms of the same species or differences between organisms.
- Species refers to a group of organisms that are able to freely and naturally interbreed to give rise to a viable offspring.
- The offspring show slight differences from their parents. For example in human beings, members of the same family differ in shape of nose, skin colour and height.
- This is because of hereditary factors/ genes each of them acquires from parents and the effect of environment.

## VARIATION.

- This is the differences among organisms of the same species.
- Variations in human beings are shown in tongue rolling, fingerprints, height, and type of earlobes (attached or free), sex, blood groups, skin colour, and weight.
- In plants variations are observed in length of leaves and internodes and size of fruits.

## Types of variation.

- Discontinuous variation.
- Continuous variation.

## A. Discontinuous variation

- This is a type of variation where there is a distinct/ definite difference in a given characteristic/ without intermediates.
- It is controlled by genes and the environment has no effect.
- Examples include:
  - Ability to roll the tongue.
  - Sex i.e. male or female.
  - ABO Blood groups/ ABO Blood group system.
  - Presence of hair in the nose or ear pinna.
  - Fingerprints.
  - Free or attached earlobes.
  - Wing length, size of abdomen, eye color in *Drosophila melanogaster*.
  - Smooth/wrinkled seed coat, green/yellow color in garden peas.
  - Melanic/light forms in moths.

## B. Continuous variation.

- This is a type of variation which shows a wide range of differences for the same characteristic/ trait from one extreme end to the other with intermediates.
- It is controlled by both genes and environment.
- Examples include:
  - Height.
  - Weight.
  - Seeds diameter.
  - Skin colour in humans.
  - Size of seeds and fruits.
  - Length of fingers in humans.
  - Milk yield in cows.
  - Length of leaves.

- For example, when the number of students is plotted against height it gives a **normal distribution curve**.

## Causes of variation

- Gamete formation**—during gamete formation/ meiosis, the following meiotic processes cause variation namely:
  - Crossing over**—exchange of chromatid segments cause new gene combinations which causes variation.
  - Independent assortment**—this is the arrangement of homologous chromosomes at the equator of the spindle during metaphase I.
    - This is followed by segregation/ separation into different daughter cells. The resulting daughter cells/ gametes contain different genetic combination which brings about variation.
- Fertilization**—it allows parental genes to be brought together in different combination.
  - This causes different qualities of parents to be combined differently in the offspring.
- Mutations**—mutation is the spontaneous change in the genetic make-up of an organism. These changes may be inherited by the offspring causing variations.

## Importance of variation

- Organisms/ individuals with advantageous traits/ variations are favored/ selected by nature and survive to pass on the traits to their offspring.
- It ensures propagation of favorable/ advantageous traits to the future generation/ offspring ensuring quality population/ species.

## THE CHROMOSOMES

- They are thread-like structures found in the nuclei of plant and animal cells.
- They contain genetic material called **DNA (Deoxyribonucleic acid)**.
- Each chromosome is made up of two parallel strands called **chromatids**.
- Each pair of chromatids is connected at one point by a structure called **Centromere**.
- In body/ somatic cells each pair of chromosomes has the same length and shape but different versions of the same genes. They are therefore called **homologous chromosomes**.
- During sexual reproduction, each parent contributes one of the chromosomes of the homologous pair.
