Paper 2

Criterion C

A positive impact of the Brunei EMR system for the patients/local citizens is a possible decreased wait time. Since all data should be

Criterion D

Privacy is an issue when it comes to the patient's data when stored in an EMR system. Public key Encryption is a possible solution to this problem.

Public key encryption uses a key-pair: a public key is used for encryption only, then a private key is used for decryption only. When data is sent to be stored in the online database, it is initially encrypted using a public key. When the staff receives the encrypted data, they are able to use the private key to decrypt the data. Only the specific private key designated to that public key will be able to decrypt the numeric code.

The process of public key encryption provides two security layers. The hackers would not be able to interpret the data without having the decrypting ability of the private key as it would be no more than a random assortment of letters and numbers.

For this solution to be successful, the private key must be stored very. It should not be accessible over a network and could instead be stored in the hardware itself. Should hackers be able to gain access to the private key, the encryption would be useless.
